INTRODUCTION

System Overview

Welcome to the phpList Manual.

This first chapter will explain what phpList is used for and give you a basic overview of how it works.

What is phpList?

phpList is used for sending email newsletters, announcements and notifications. It is designed to send a single message (a **campaign**), by email to large numbers of recipients (**subscribers**).

You organise your subscribers into **lists** and you can import email addresses from your email account, online shop, blog or database. You can also import **attribute** data, for example, subscriber name, city or shoe size.

Campaigns are composed in a web interface and can be **personalised** for each subscriber. Personalisation is done with the use of placeholders which display attribute data within the text of the emails, as well as unique links that **allow subscribers to join or leave** lists easily. You can use plain text, HTML and templates.

Once a campaign has been sent, phpList will show **statistics** about it. This will include **opens/views** (who read the campaign), **clicks** (who clicked which link in the campaign) and **bounces** (which addresses were incorrect and delivery failed). Bounced mails and unsubscribes are automatically removed from the system, which will benefit future **delivery of campaigns**.

phpList is Open Source software and it is published under the AGPLv3 licence. You can install and host phpList on your own servers or you can use it via the phpList Hosted service.

A quick tour of phpList

phpList has an attractive web interface and a wealth of features to explore.

Campaigns

Composing and sending campaigns is achieved by following a step by step process.

The screenshot shows the 'SEND A CAMPAIGN' section of the phpList interface. At the top, there are five tabs: 'Content' (highlighted in blue), 'Format', 'Scheduling', 'List', and 'Finish'. Below the tabs, the 'content' tab is active, showing fields for 'subject' (containing '(no subject)'), 'From line' (containing 'admin.list@mydomain.co.uk'), and 'Content' (with options 'Send a webpage' and 'Compose message' selected). The 'Compose message' area contains a rich text editor. On the right, there is a 'NEXT' button and a navigation sidebar titled 'NAVIGATION' with links like 'Dashboard', 'Help', 'About phpList', 'Log out', 'Send a campaign', 'List of campaigns', and 'Manage campaign templates'. The sidebar also includes a 'Recently Visited' section with links to 'Send a campaign', 'Dashboard', 'Settings', and 'Search subscribers', along with a language selection dropdown set to 'ENGLISH'.

Subscribers

In phpList you upload your contacts once and the information is ready to use every time you send a campaign.

The screenshot shows the 'IMPORT EMAILS' section of the phpList interface. It displays three methods for importing emails:

- copy and paste list of emails**: Represented by a clipboard icon.
- import by uploading a file with emails**: Represented by a file icon with a downward arrow and a small computer monitor icon.
- import by uploading a CSV file with emails and additional data**: Represented by a CSV file icon with a downward arrow.

You can group subscribers into one or more lists

What is Open Source?

Open Source, or "Free Software", means that the original programming code is made freely available and may be modified. In practice this means that; phpList is very adaptable, easy to change and improve. Open Source development relies on communities of users contributing to the project they use. You pay nothing for the software, but you are encouraged to collaborate with the project through contributing code and/or through bug reports, translations, documentation, spreading the word and if you feel it has enriched your life, you can even donate!

What is phpList.com?

phpList.com offers phpList as a service is the cheapest way to have a fully working installation without having to worry about servers, blacklisting, bounces and deliverability. We manage the day to day maintainance of the software including updates and security.

Using phpList.com is also a great way to support the future development of phpList.

What does phpList not do?

phpList is a one-to-many email program. It cannot easily be used to have "email conversations" many-to-many as you might do on software such as mailman

Case Studies

Below are six examples of how phpList is used, including a small business, a large business, a city and a community group. They are ordered by the number of emails sent per month.

- Large Business - 500,000 to 6 million emails per month
- Artist & Record label - 10,000 emails per month
- Re-seller - facilitating several phpList installations
- Small business - 500-1000 emails a month
- Government department - 500 emails a month
- Community Group - less than 100 emails a month

Large Business

BroadwayWorld.com is "the largest theatre website in the world" and is devoted to all things Broadway and theatre. Their website has news about shows, audition listings, user forums and a blog.

BroadwayWorld.com has around 500,000 subscribers on their phpList system, and these are divided into smaller lists by State and/or Country, for example.

They grow their lists by sign up's though their website and from special offers and promotions throughout the year.

TODAY ON BROADWAYWORLD.COM

InDepth Interview: Sir Tim Rice On FROM HERE TO ETERNITY Story To Stage To Screen, Plus CHESS, ALADDIN & More

by Pat Cerasano

Today we are taking a multi-week look at stage and screen musical masterworks about the forthcoming Fall presentation of the now-musical *FROM HERE TO ETERNITY*, including a movie theater retrospective early next month, the show and *EAT PRAY LOVE*. Outlining his impetus for pursuing a musical adaptation of the acclaimed novel upon which the 1953 Academy Award-winning film is based, Rice reveals what drew him to the project and what viewers can expect from the show's story and music. He also discusses working with director Stuart Burman on the new production. Additionally, Rice sheds some light on the specifics of casting the show, with a special emphasis on the controversial elements contained within the material. Plus, Rice shares specific examples of how some of the legal challenges in the now-controversial novel were created, as well as his favorite musicals from the 1950s. Finally, he discusses his recent role as the Author in a new, preliminary workshop production for an American production, too. Furthermore, Rice reflects on his work with recently deceased entertainment icons Robin Williams, on *ALADDIN*; Lauren Bacall, on *THE FAIR*; and Richard Attenborough on the *JOSEPH & THE Amazing Technicolor Dreamcoat*. Also, Rice shares new details on the forthcoming 30th anniversary 9-disc special edition of *CHESS* set to be released next month. All of that, and much, much more... (more...)

BroadwayWorld started their newsletter in 2003 when they launched their website: a newsletter has always been integral to their business model. Initially they used proprietary hosted solutions which they found too expensive. They then tried using a 'homegrown' solution but they soon outgrew its capabilities. For them phpList was the happy medium: easy to scale, free and within their technical capabilities to host. BroadwayWord has been using phpList since 2009.

Artist & Record label

Attila Fodor (FineCutBodies) is a musician, producer and a former developer (of playstation games!).

He runs an indie record label which has had more than 60 releases and hundreds of gigs since 2000. He goes on world tours and has aired over 700 hours of radio content in the last 15 years. He also teaches at the Budapest School of Music Technology, running a regular class on digital technology and basic sound design paradigms. He is a regular phpList contributor.

FineCutBodies community profile

FineCutBodies started a newsletter when he founded his record label in 2001. He began by pasting email lists into the Bcc line in his mail software. When the list started to grow he tried a few different newsletter programs.

In 2014 he started searching for a newsletter software which could provide bespoke functionality and smooth website integration. As an audiovisual coder and video game developer, FineCutBodies has used his coding experience to customise phpList to his needs.

fine cut bodies download for subscribe offer

One example of this customisation is his download-for-signup system, where a visitor to the FineCutBodies.com website requests a free track/tool download in exchange for signing up to the mailing list.

They then receive an email with the download url in: when the url is clicked the visitor is subscribed to the list on his phpList system.

Additionally, subscribers are integrated seamlessly into the phpList system using javascript, rather than using the standard phpList subscribe pages.

fine cut bodies subscribe button on homepage

FineCutBodies has a total of 10k emails across several public lists, as well as a private list for pre-release news aimed at music journalists.

The subscribers come from various online contact and sign up forms (see screenshot as well as the subscribe-for-download deal). FineCutBodies send one campaign per month per list and have an average recorded open rate of 20-30%.

Re-seller

Marsha Perry is a website developer. She specializes in small business websites, WordPress websites and WordPress coaching. Her company also provides phpList installations, migration, updates and integration.

marsha perry website

Marsha also uses phpList for her own newsletter and it is her software of choice for newsletters in most circumstances. As a developer she finds it reliable: she said “some applications are ‘twitchy’ or delicate. phpList is a workhorse.”

Her customers like phpList for a whole variety of reasons:

- They can have multiple lists and sign up forms with one installation.
- They can migrate to phpList without making subscribers opt-in again.
- They love that the software is free to use and well-supported via the forum
- They appreciate the flexibility and control they get.

Marsha does not think many of her customers are really aware of what Open Source means, but she feels they do appreciate some of the consequences of phpList’s Open Source status, especially that Marsha can tweak the code for them.

marsha perry newsletter signup phpList

Marsha also offers phpList Hosted, as it is the perfect solution for one of her customers with a large mailing list. They had previously considered moving that customer’s website to a host that allowed more outgoing emails per hour. Then she realized that with the Hosted version of phpList the website did not need to be moved.

Small Business

Ethical Pets is an online store [ethical pets gazette phplist](#) based in the UK which sells Bio/Organic, ecological and fairly traded pet products.

They began using phpList Hosted to send out a newsletter called *The Ethical Pets Gazette* five months after they launched their store, and have now been running the list for nearly three years.

Ethical Pets

- Publicise the ethical qualities of new products
- Share blog articles about environmental and animal welfare campaigns
- Encourage the feeling of friendship and community present in fairs and festivals

The Ethical Pets Gazette now has 750 subscribers. Most are customers whose addresses were exported from online shop software. There is an AJAX sign up form on their shop front and they sometimes segment their lists to target specific customer groups, for example, dog owners or cat owners.

Their average open rate is as high as 36%.>

Government Department

The Parliament of South Africa is legally required to inform the citizens of South Africa about their work. Responsibility for this task falls on the manager of the Content and Information Unit at Parliamentary Communication Services, who is mandated to spread this information to as broad a range of readers as possible.

One of the methods used is the **Insession** newsletter, which is published on a monthly basis on their website as a pdf and e-book.

phpList is used to target the audience that wish to receive this newsletter digitally. *insession* is sent to subscribers as an HTML email with links to longer articles on the government website.

insession magazine email

The Content and Information Unit have used phpList since March 2013, and the software was chosen by the IT department.

Currently the *Insession* list has about 450 members, all of whom subscribed themselves via a web form during the normal course of parliamentary business.

in-session sign up form

Four staff of the Content and Information Unit manage the phpList installation. Two have access to the subscribers' replies and two upload the newsletters as an ebook and pdf onto the parliament.gov.za website.

The government of South Africa also uses phpList to run an internal parliamentary list.

Community Group

The student group アナグマ・エイサー (Anaguma Eisa) at UW-Madison teaches and performs Eisa, a form of Japanese folk dance, originating from the Ryukyu islands of southern Japan.

The group have been using phpList since 2014 to further their mission to encourage people of all ages and abilities to develop their full potential through cultural understanding and performing arts.

collecting emails for phpList on paper

Before adopting phpList they had been copy-and-pasting a small list of addresses into Bcc for each email update. Now in their second year of being an officially registered student organisation this method become untenable.

They decided to set up a newsletter and list management system to:

- Keep prospective and current members engaged with the latest activities and concerts
- Communicate better with those who do not regularly check Facebook and Twitter
- Communicate by email more often, because this channel is more visible/high impact than social media
- Tell people about events in a way that is easier to refer back to (than social media)
- Create a system which can be run by multiple group members so they can share administrative responsibilities

Lucas Schneider, the president of Anaguma Eisa, chose phpList because:

- It is Open Source software
- Liked the clean look of the interface
- Felt it would be easy to manage several different lists
- Wanted to be able to embargo and end campaigns relating to performances (scheduling)
- Wanted the flexibility to compose anytime but send at a regular time (scheduling)
- Wanted to edit the 'from line' with ease
- Wanted to take advantage of the detailed statistics provided with each campaign

a subscribe page, phpList

In the first few months of using phpList their list grew from 15 emails to 35 emails, across 3 lists. The society run:

- A list of active members of the organization
- A list for announcing upcoming performances
- A list for a general newsletter

collecting subscribers via twitter

The group add new members to their lists in three ways:

- Manually adding addresses from paper lists from student organization/freshers week fairs (photo 1)
- New sign ups from the form integrated into their website (photo 2)
- Sharing the subscription link on social media (photo 3)

They send 6 to 7 email campaigns each month: one email a week to active members with information about rehearsals and administration, one email a month to announce performances and a more general newsletter every couple of months. Their emails have an impressive average open rate of 50%.

About this manual

This manual has been written by the phpList community documentation team, individual volunteers, companies and phpList Ltd staff.

Aims

This manual will teach you how to use phpList. It provides real life examples where possible and chapters are goal oriented. We hope you will come away from each chapter with inspiration and motivation as well as an education!

Target audience and assumptions

The manual is aimed at users with average tech skills who are starting at the beginning with phpList. The first sections of the book assume that the reader has access to a pre-configured phpList install to play with, perhaps on phpList.com or provided by their employer. If this is not the case, then there are chapters about installing phpList later in the book which can be used to get started.

Disclaimer

Software is not static, it continuously changes. phpList is no different from other software, in that it is regularly updated to fix issues, add new features and respond to a changing environment of browsers and internet technology. This manual attempts to provide you with a guide to how phpList works, but the version you are using may be different from what is described here. The manual should help you to work phpList in a general way, but you may need to interpret it for your situation to make phpList do what you want it to do.

How to use this manual

Most chapters will walk you through a task, with a screenshot for each stage. It may be that you only require assistance with one aspect of a task, in which case skip ahead.

Styles

In this manual, words in **Bold** generally mirror the word in the application itself. Additionally, each level of a menu is signified with a >. If you need to go to Subscribers in the main menu, and then click Add new in the sub menu, we would annotate this as **Subscribers > Add new.**

Documentation team

Thanks to all the the following contributors, in no particular order:

Dragonrider, Nikita Lyalin, Paul Mellors, Dan Waterloo, Elisa, Michiel, Mariela, Orsiris de Jong, JoJo, Lucas Schneider, Guido Hornig, Vedran Vucic, Sylvain, Andreas Tolfsen, Titano, Charlie Russell, Joseph Morris, Björn Balazs, Mindhack, Alexandru Berendei, Marius, Sam Tuke, Marcela Lopez Levy, kitchm, Rodrigo and Linda Ainsworth.

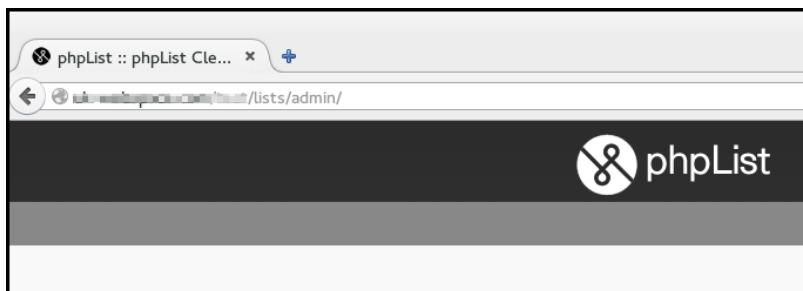

BASIC USAGE

Logging In

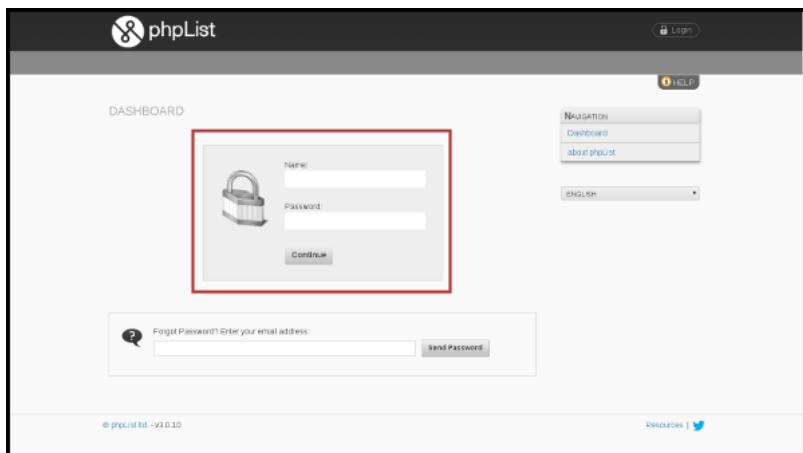

The first thing you do to use phpList is log in. This chapter assumes that you already have an installation and that you have a user name and password.

phpList when you are logged out

When you are not logged in, any page you visit in your phpList installation will prompt you to enter your username and password. For example, if I visit my dashboard, which usually resides at my-domain.com/lists/admin:

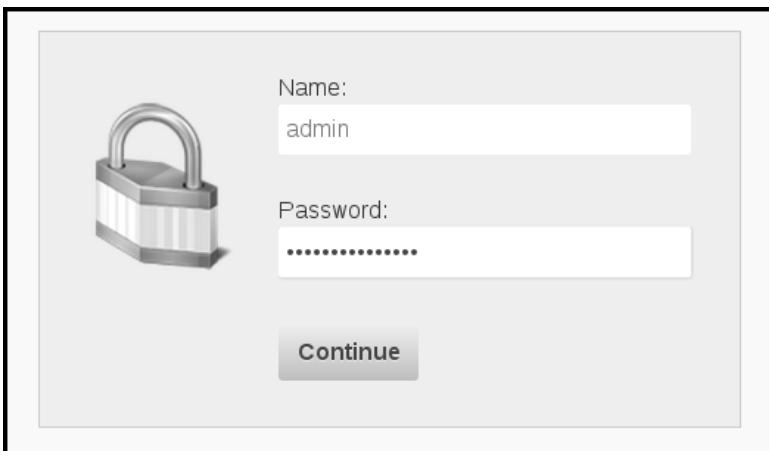

I would see my login prompt, marked below in red.

How to log in to phpList

To log in, enter the username in the **Name:** box and password in the **Password:** box, then click **Continue**. The default username is **admin**, however, your system administrator may give you a more personalised login.

When you have successfully entered your username and password you will see the page you were trying to access. In this case, the **Dashboard**.

The screenshot shows the phpList dashboard. At the top, there's a navigation bar with links for Subscribers, Campaigns, Statistics, and Info. On the far right of the header is a power button icon. The main area is titled "DASHBOARD" and contains a "Main" section with four large buttons: "Send a campaign" (with a gear icon), "View current campaigns" (with a magnifying glass icon), "Manage subscribers" (with a person icon), and "View statistics" (with a bar chart icon). Below these are three smaller buttons: "List and user functions", "Campaign functions", and "Plugins". To the right of the main content is a "NAVIGATION" sidebar with links for Dashboard, Help, About phplist, and Log out. It also includes a "Recently visited" section with links for Dashboard, Import subscribers from text, and Import emails. A language selection box shows "ENGLISH".

It is a good idea to bookmark your dashboard and use it as the primary way to access your phpList. Depending on your configuration, your dashboard might look a little different, for example there might be more items on your menu bar.

How to log out of phpList

The **Logout** button will always display in the top right of your installation.

Remember to logout when you are not using phpList: your installation contains the personal data of your subscribers and it is your responsibility to keep it secure.

This screenshot is identical to the one above, showing the phpList dashboard with its various sections and sidebar. However, the "Logout" button in the top right corner of the header is highlighted with a red rectangle, drawing attention to it as the focal point for logging out.

Adding your first Subscribers

This chapter will explain how to make a **list** of email recipients, called **subscribers**, and how to send your email **campaigns**.

phpList is a powerful tool: there are several ways to add subscribers and demographic information about them (name, location, interests etc).

In this chapter we are going to cover the most basic scenario.

How to get your first subscribers

The chances are, if you are planning to use phpList, you have some subscribers already. You may have a complex database of contact information, a list you exported from an application, or a simple list of emails on a sheet of paper.

In this example, we will be following the progress of Ethical Pets, who we introduced in the Case Studies chapter. They will be emailing customers of their online shop. The list of emails was obtained by exporting a list of customer emails from their shop software.

Create a list in phpList

First of all you need to create a subscriber list. This will help you organize your subscribers. In phpList, you *must* have at least one list, but you can have many of them. In this example, we will create just one list called *The Ethical Pets Gazette*, which is the name of the Ethical Pets newsletter.

First, navigate to **Subscribers > Subscriber lists** in the main menu.

The screenshot shows the phpList interface with the 'Subscribers' tab selected. A dropdown menu is open under 'Subscriber lists', with the option 'Lists that subscribers can sign up to' highlighted.

Subscribers Campaigns Statistics System Config

Search subscribers
Manage subscribers
Subscriber lists
Import emails
Export subscribers
View bounces per list
Suppression list
Reconcile subscribers

Lists that subscribers can sign up to

This will take you to a page which shows you all your lists. Currently you can see just one list, a system default list called **test**.

To create a new list click the **Add a list** button.

The screenshot shows the 'SUBSCRIBER LISTS' page. It displays a single list named 'test'. The page includes navigation links for 'Dashboard', 'help', 'Log out', and a 'RECENTLY' sidebar with links for 'Edit a list', 'Subscribe', 'Export sub...', 'List memb...', and 'Edit a list'.

Send a campaign **Import some more emails**

Check it out!

If we return to **Subscribers > Subscriber lists** in the main menu, we can see the new list and its subscribers.

The screenshot shows a software interface for managing subscriber lists. At the top, there's a dropdown menu labeled 'UNCATEGORISED' with a downward arrow, followed by 'Categorise lists' and 'Add a list' buttons. Below this, it says '2 lists'. The main area is titled 'lists' and contains a table with three columns: 'LISTS', 'MEMBERS', and 'PUBLIC'. The first row shows a list named 'test' with 0 members and an order of 0. The second row shows a list named 'The Ethical Pets Gazette' with 614 members (2 active) and an order of 0. Each row has a set of icons for edit, delete, and other actions. At the bottom left is a 'SAVE CHANGES' button.

Asking and assuming permission

Before you start to make lists, take some time to consider who you add. A healthy email list is full of people who *want* to receive your mail: they should have given you their email address voluntarily and ideally been asked for permission before you add them to the system.

There are legal requirements in some countries which reflect the importance of informed or assumed permission, for example, anti-spam laws in Canada.

Long term subscriber list health

The ideal situation is for your list members to join and leave your list as they please. You can set up **Subscribe pages** so people can subscribe themselves to your lists, and the (mandatory)

Unsubscribe link in your emails will allow people to leave if they want to. These are discussed in detail in other chapters.

While you may be keen to spread your message as far and wide as possible, always bear in mind that excessive, aggressive and intrusive emails can tarnish your brand. Don't become a spammer!

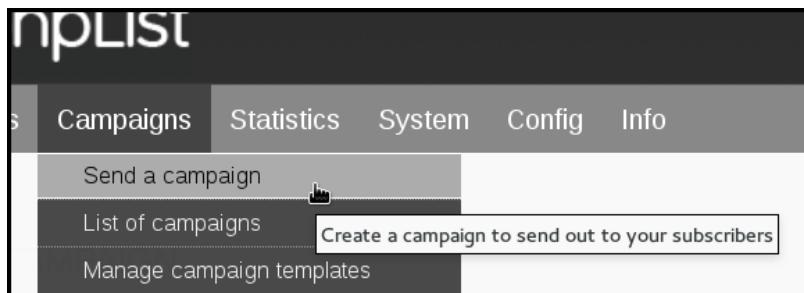

Composing your first campaign

In this chapter we will talk through composing and sending a very basic email campaign, which contains a simple piece of news and a single image.

The example follows on from the previous chapter, using Ethical Pets. In this scenario a "short dated" cat food needs to sell quickly. They decide to email all their customers to tell them about the special offer.

Getting Started

To start a new campaign in phpList, navigate to **Campaigns > Send a campaign** from the main menu.

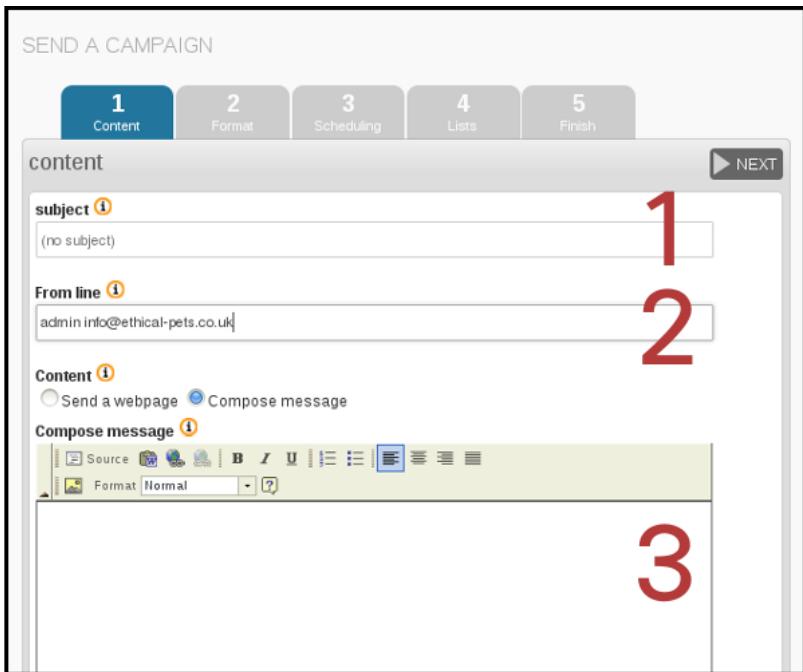

This will open up a five-tab dialogue which will guide you through the build-and-send process. *Please note that various settings and plugins add more tabs.*

Message composition of the campaign is done in the first tab - the **Content** tab.

The Content Tab

There are three tasks to complete in this tab. You must write your **subject**, edit the **From line** and create your message in the **compose message** window.

Subject line

The subject of the email is the first thing that your subscribers will see, so it's very important. Make sure that your subject line:

- Is *honest* about the content of the email
- Avoids spammy sounding words or phrases (Free, hot, opportunity, risk free, etc)
- Is less than 50 characters long if possible
- Is eye-catching and appealing
- Is easy to understand, with a clear meaning or appealing hint
- Contains a "call to action" if possible/appropriate (so Read, Buy, Sign, Donate)

The screenshot shows a software window with a title bar containing 'content' and a 'NEXT' button. Below this is a section labeled 'subject' with an orange info icon. A text box contains the subject line: 'Puuurfect: 50% off Organic Cat Food (BB: 20/8/14)'. The background of the window has a light grey gradient.

Sometimes you will have to compromise, prioritizing some of these points above others.

Here is what Ethical Pets said about this subject line:

"The most urgent goal was to sell the food, so the subject needed to be eye-catching. 50% off is pretty eye-catching, however, we know that it could get flagged as spammy by filters, so the wording was a little risky. We also needed be super clear that the food was short dated.

To both things make this possible within the 50 characters we had to shorten the super clear "Best Before Date: 20th of August" to the more concise "(BB: 20/8/14). This would make sure that the best before date would be visible in the subject line.

We also decided that the tactile and soothing "Puuuur" sound in the little joke at the beginning was worth sacrificing a direct call to action such as "Buy Organic Cat Food, 50% off", especially as using "buy" and "50% off" in the same subject line would make it even more likely that the mail would get flagged as spam."

The From Line

The second step is to edit the **From line** - your subscribers will also see this information. In phpList this information is usually auto-filled from settings in your system configuration, and is formatted Name [space] email. In this case the automatic information was originally: admin info@ethical-pets.co.uk.

Ethical Pets changed it to "Admin" to "The Ethical Pets Humans". They said

"Admin seemed a little unfriendly for the purposes of this email, so we changed the name to something more fun, and it really fitted into our campaign. however, the email remains the same. We usually just write Ethical Pets though. We always use our real email, because sometimes we get replies from customers too, which is great."

From line 

The Ethical Pets Humans info@ethical-pets.co.uk

Content 

Ethical Pets allowed replies to their email, however, you may wish to use a "do-not-reply@example.com" style email: this depends on the number of replies you tend to get, what they are about, and the purpose of the email.

For detailed information about formatting the **From line** click in the **i** information button next to it.

The Content

The next step is to compose your message. In this example, we will compose the message directly in the phpList **Content** window.

Assuming you have your What-You-See-Is-What-You-Get (WYSIWYG) composer plugin installed and enabled (usually FCKEditor) you will be able to edit in a way that is similar to a Word-Processor or a blog site. In the example below, we have composed our text, and are using the **Italic** button to draw attention to some text.

Compose message 

Dear Cats (and your associated humans) (wants)

Good news:

Some silly human types at Ethical Pets have accidentally over-stocked Yarrah Organic and MSC certified dry cat food (the one with fish in it).

They have lots of 3kg bags of this delicacy that are getting near their "best before date." The date, which is the 20th of August, is the last day that the Yarrah Chefs guaranteed that the vitamin and mineral contents are at the levels stated on the packaging – so the food should still taste good for a while yet.

So dear felines, Ethical Pets are hoping some of your humans would like to "bag a bargain" and get some of these these bags for you. They will be 50% off, which is quite cheap for such a lovely ethical food.

They are now priced at £11 for a 3kg bag.

If you make your cat-eyes big and round and cute, they might click here and get you some! Yummy :)

Lots of Love and fuss

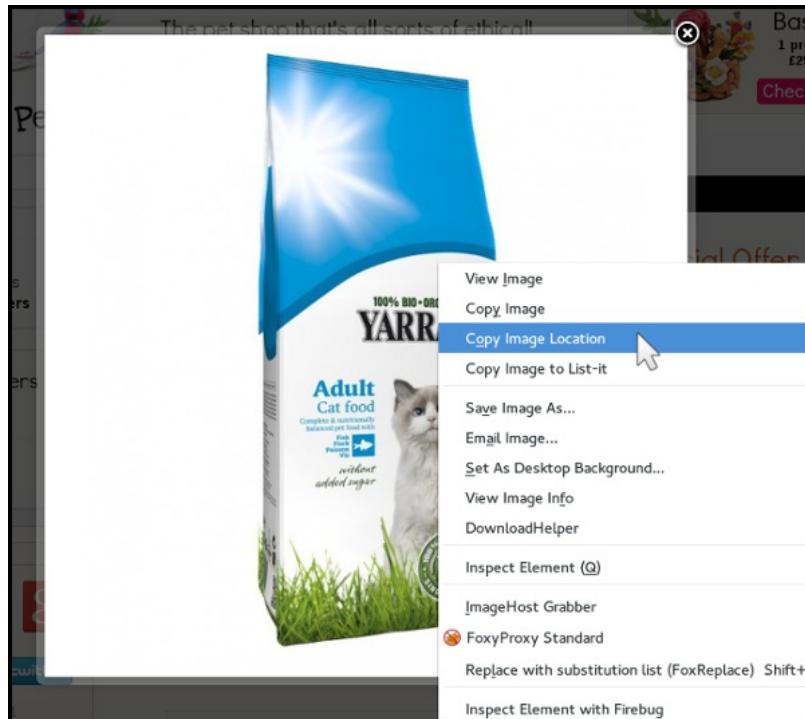

Anna & Joey

The Ethical Pets humans

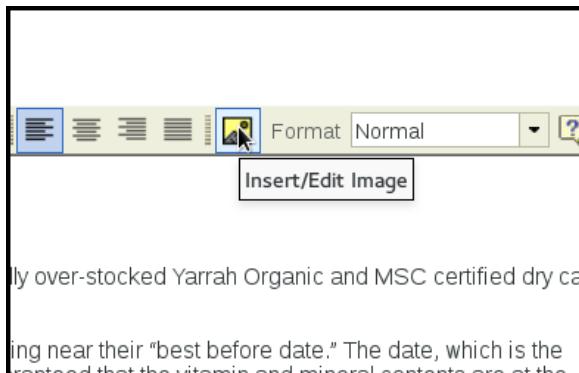

Adding an Image

The simplest way to add an image to your campaign is to embed one from your website, or from an external source such as Wikimedia Commons. To do this you need to find the URL of the image from your site.

Depending on your browser, this may be done by right clicking on the image and clicking **Copy Image Location** or similar (in Internet Explorer it may be under right click **Properties**).

Then, in your phpList window click the **Insert/Edit** Image button in the WYSIWYG toolbar.

lly over-stocked Yarrah Organic and MSC certified dry ca

ing near their "best before date." The date, which is the
printed on the bag, indicates that the vitamin and mineral contents are at the

You will then see the **Image Properties** dialogue.

Paste the image url into the **URL** box (highlighted in red below) by using control-v or right click **Paste**. You should see the image in the **Preview** box below. If there is an error, the most likely culprit is the URL.

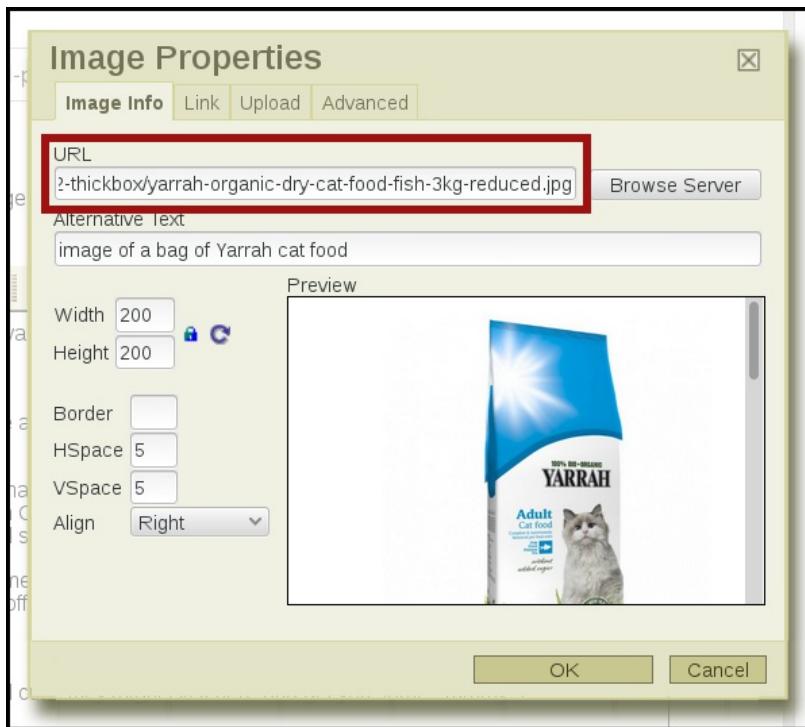

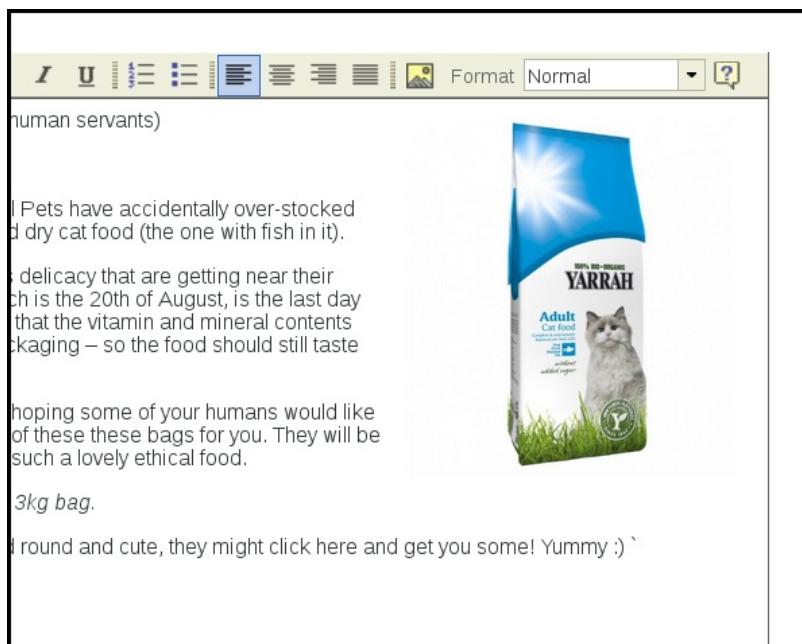

Image formatting and metadata

You should include an **Alternative Text** for the image. This will show in place of the image when the image is suppressed by the recipients email software, which is quite common. A good alternative text helps encourage your reader to decide to view the images in the email: this in turn makes your **Campaign Statistics** more accurate.

You may also wish to change the display size of the image: Ethical Pets chose a **Width** of 200, and the height was adjusted automatically because the **Lock Ratio** padlock is locked). You can also chose to **Align** the image, in this case they chose **Right**, to make it display on the right hand side of the email. They also gave it an **HSpace** and **VSpace** of 5, which added 5px (just a little bit) of space between the email text and the image.

Once you are done, click **OK**.

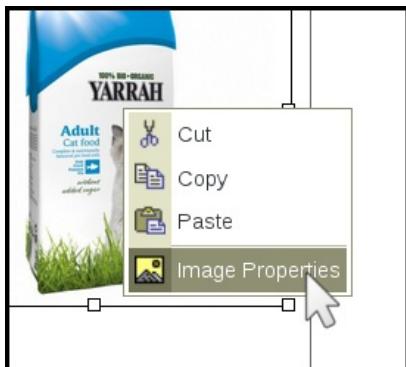

The screenshot shows a Microsoft Word ribbon interface with the 'Format' tab selected. Below the ribbon, there is a toolbar with various icons for text styling (bold, italic, underline, etc.) and alignment. The main content area contains several paragraphs of text and an image of a bag of Yarrah cat food. The image is positioned on the right side of the text. The text includes:

- "human servants)
- "I Pets have accidentally over-stocked
d dry cat food (the one with fish in it).
- " delicacy that are getting near their
ch is the 20th of August, is the last day
that the vitamin and mineral contents
ckaging – so the food should still taste
- " hoping some of your humans would like
of these these bags for you. They will be
such a lovely ethical food.
- " 3kg bag.
- " round and cute, they might click here and get you some! Yummy :)

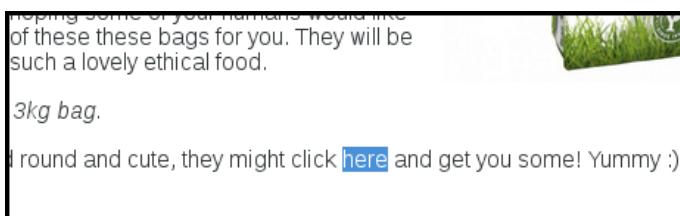

The image of the cat food bag is a blue and white bag with a picture of a fluffy cat on it. It is centered in the text block.

You will now see the image displayed in your email. If you wish to edit it again, right click the image and click **Image Properties**.

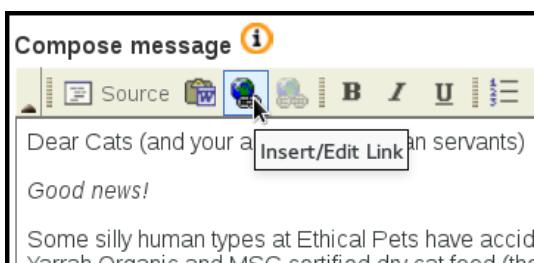

Creating a Text Link

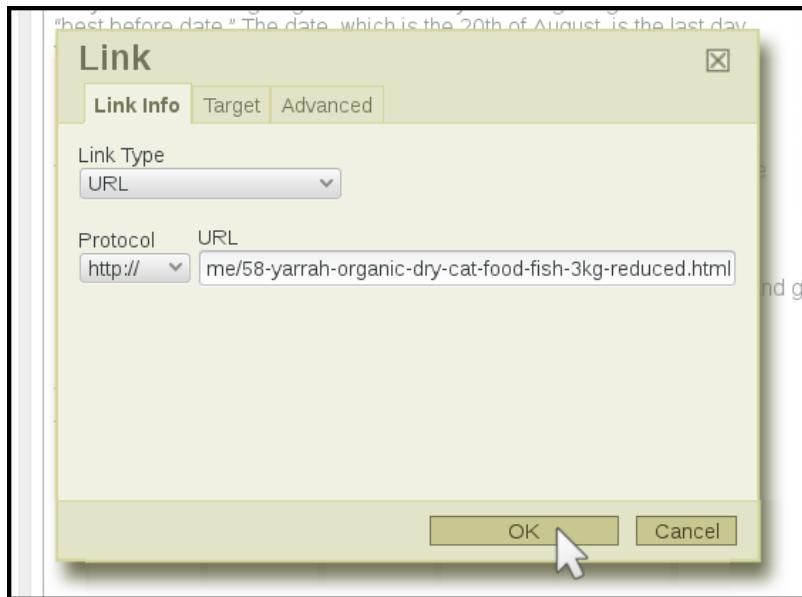

Now a link to the store was needed, to show subscribers where to buy the food. To create a link, first highlight (with your cursor) the bit of text that you want to become a link:

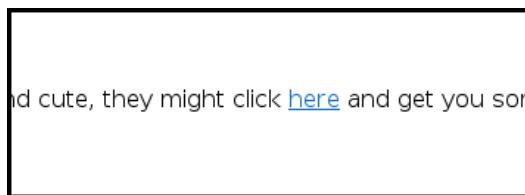

Next you click the **Inset/Edit Link** button

Finally, you paste the URL of the page you wish to link to into the URL box, and press okay.

When your subscribers receive your mail they will see the link, as below, and will be able to click the text to go directly to your website. In your campaign statistics you will see how many clicks you had.

Once you have finished composing your message, you are ready to move onto sending your campaign.

Test your campaign

It is easy to skip this step because sending the mail is so exciting, but it is *really* important to check... and after all, it only takes a few minutes.

To send a test you need to enter your email into the **Send text** box at the bottom of every screen in the campaign workflow. You can send multiple test emails by separating the addresses with a comma - it is a good idea to test in both Webmail (like googlemail) and a client (like Thunderbird).

All the emails you send a test to must already be on one of your lists: if they are not, you will be prompted to add them.

Once you have entered the email, click **Send test**.

□

Check that the

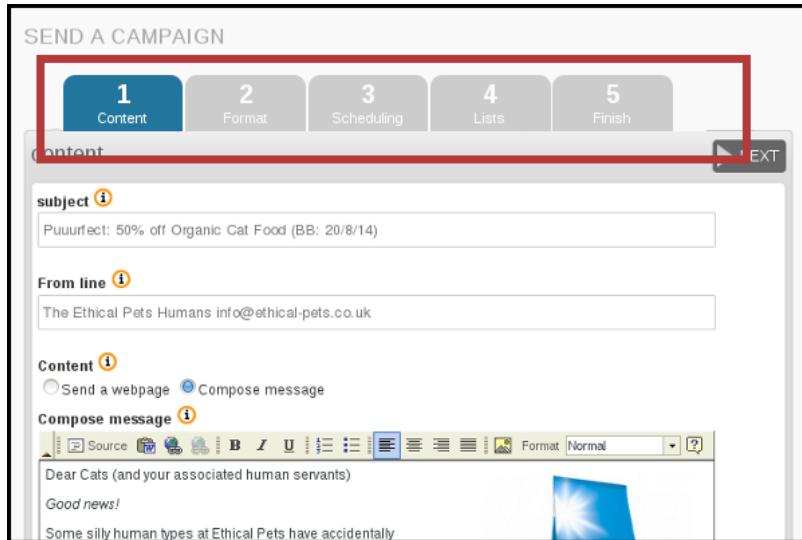

- formatting is displaying as expected
- your links go to the right places
- you have not made any spelling errors.

If you find a mistake, edit your campaign and test again. Once happy with your text part of your Campaign, click on the **Next** button.

phpList click next

Sending your first campaign

Once you have composed your html message, you are ready to move through the tabs (highlighted in red below) which will guide you through the process of sending your first mail.

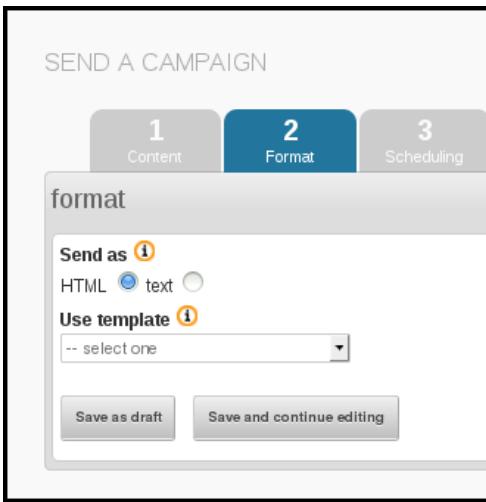

Format

If you have a template set up already then the **Format** gives you the opportunity to choose it by selecting it from the **Use template** drop down. Your html message will then be wrapped in the template during the sending phase.

You can send a test message using the **Send test** box at the bottom of the page, to see what your email will look like.

Click **next** when you have selected your template. If you do not yet have a template, leave the -- **select one** in the dropdown and click **next**.

Schedule your campaign

After your tests you need to schedule your campaign should now be on tab **3: Scheduling**. Remember, some plugins and settings add extra tabs so the tab number may change (but the name should stay the same).

In this case we want to send the mail straight away, so the **Embargoed until** time needs to be left as the default, which is slightly in the past.

Additionally, because this campaign is not time sensitive, for example there is no deadline for the special offer, we can leave the **Stop sending after** time and date as the default too (far in the future).

When you have finished entering the scheduling information, click **next**.

Reschedule every -- do not reschedule

Reschedule until 12 August 2014 17:00

BACK NEXT

Select your lists

One of the final stages in the campaign workflow is to choose the list(s). In this case there is only one list to choose from, which is **The Ethical Pets Gazette**. The options for **All Lists** and **All Active Lists** are also useful; the former sends to every list, public or private, and the latter sends to all public lists.

Remember that phpList will only send each subscriber one copy of each campaign, even if they are on several lists: you don't need to worry about sending people duplicate copies.

Sending your campaign

Sending in phpList is a powerful tool with many possible configurations. It is possible that your system administrator will give you different instructions for sending or will send on your behalf.

The final tab in the sequence contains a few useful details and the button which triggers sending.

First of all you can chose some emails that you wish to alert when your campaign starts sending and finishes sending. This can help you stay organized.

You can also choose to **Reset click statistics** - this means that any clicks or opens recorded when you were testing your campaign will be forgotten, so when you get new clicks and opens you know they are from your subscribers.

send campaign

Save as draft

When you are ready to send, click **send campaign**.

Process your queue

Clicking **send** will add your campaign to your **queue**. There may be only one campaign in the queue, or there may be several. Click **process queue to** send the campaign now.

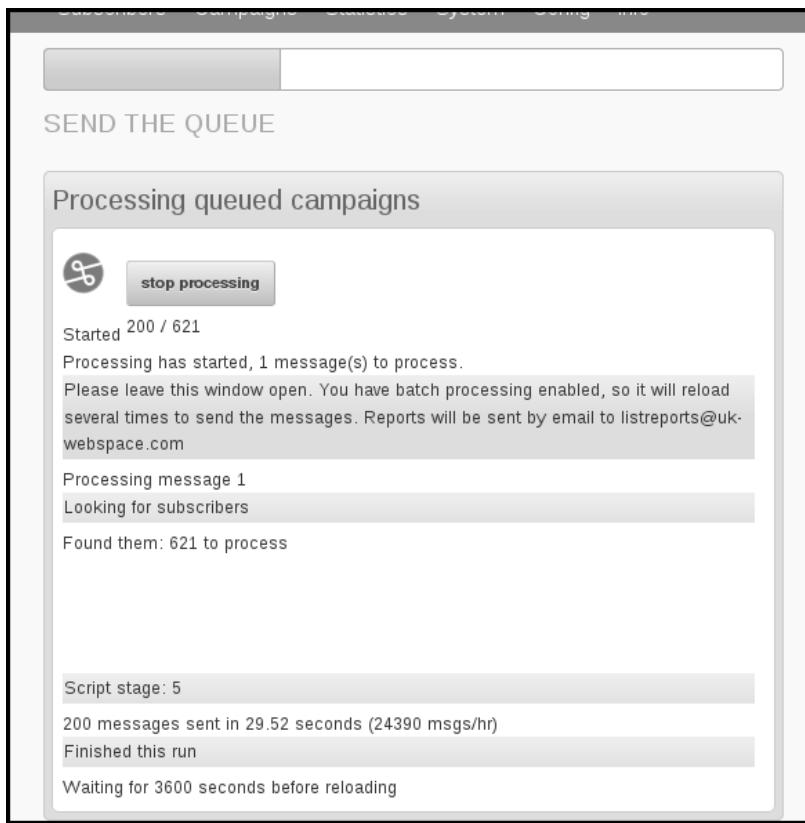

You will see the queue start to process, with a spinning phpList logo.

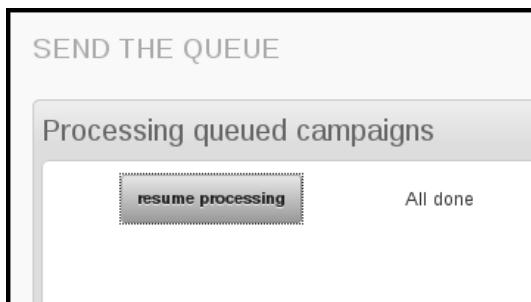

Next you will see something like the image below, depending on how your system is configured.

Do not close your browser window until the process is complete, unless your system administrator tells you otherwise.

All done?

When your queue has finished processing you should see the following screen:

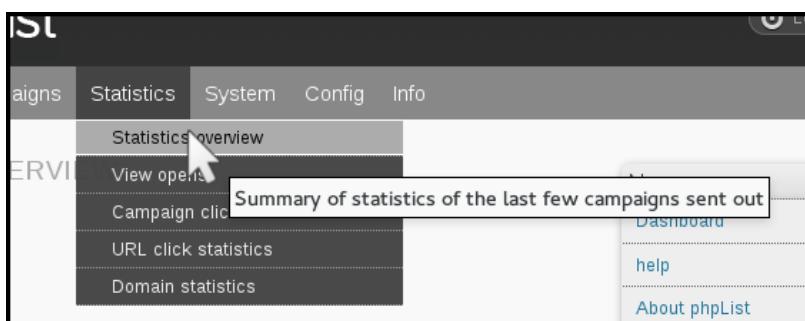

Depending on your configuration and list size, you may need to refresh the screen and click resume processing a few times until the process is complete

Basic Campaign Statistics

Now that you have sent your first campaign, it's time to take a look at your campaign statistics. In this chapter we will look at **Sent**, **Rate** **Bounces**, **Forwards** and **Views**, the four most fundamental campaign statistics.

The statistics overview page

First, go to **Statistics > Statistics overview**.

This will show you a summary of all the campaigns you sent in the past year (in this case, we have just sent one).

A screenshot of the 'Statistics overview' page. At the top left is a button 'Download as CSV file'. Below it is a table with a single row. The table has columns: 'SENT', 'BNCS', 'FWDS', and 'VIEWS'. The row contains the following data: 'Puuurfect: 50% off O ... : 20/8/14)', '621', '0', '0', and '156'. At the bottom right of the table, there is a small box with the text 'DATE: 15 AUG 2014 / RATE: 25.12 %'.

Sent

In this example, we sent our first campaign to **621** subscribers and this is reflected in the **SENT** column. It is useful to see how many subscribers you have for each campaign, so you can see your list grow over the year.

Bounces

The second column **BNCS** shows the number of emails that "bounced." A bounced email is one that cannot reach its intended recipient. This could be caused by any number of things, for example:

- The email is incorrect, does not exist or has an error such as an expired domain
- The Mailbox is full (this may be temporarily or not)
- A badly configured auto-responder (automated "I'm on Holiday till" or "I got your message and will reply soon" type mails)

The exact definition of a bounce depends on your phpList configuration, and it can take several days for a bounce to be registered on the system. An email which continues to bounce will eventually be either unconfirmed or added to a do-not-send list.

A high bounce rate may be a sign of poor list quality.

In this campaign there were **0** bounces.

Forwards

The third column **FWDS** shows the number of people who have forwarded the mail through the phpList **ForwardToFriend** system. This is dealt with in Advanced Statistics.

"Views"

This is the most exciting of your statistics, but also the most misleading.

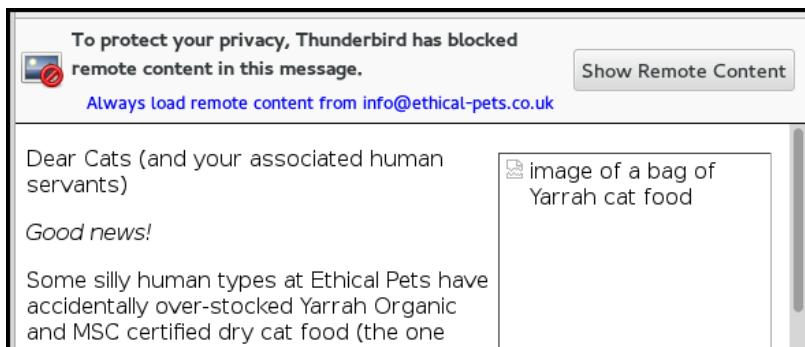

In this case, our email was "viewed" by **156** of the 621 recipients, which gives us an open **RATE** of **25.12%**. However, it is important to understand the limitations of this statistic, so you don't become frustrated or disillusioned by what may seem like low readership levels.

The **VIEWS** statistic:

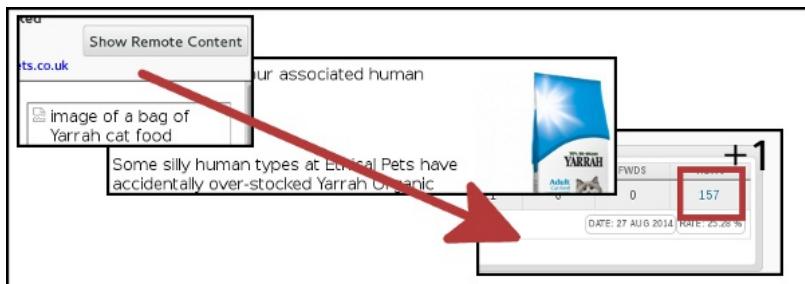

- Tells us how many people were *recorded* opening their email (and presumably read the contents)
- Tells us the *minimum* number of people who opened the email
- And gives us a rate that *reflects* the number of people opening an email compared to other emails we send.
- Does not tell us exactly how many people opened the mail, or what they did when they opened it.

An "open" is not always be recorded.

The major cause of inaccuracy when recording views is *image blocking*. If images/remote content are blocked by a subscriber's email software, then the action of your subscriber opening the email *cannot* be reported back to phpList (or to any system). Image blocking is therefore quite commonly used as a privacy feature by email and webmail clients.

Only when your subscriber clicks, for example **Show Remote Content**, is the view recorded in your campaign statistics.

Still a useful statistic...

This inaccuracy is the same for everyone, no matter which software they are using to send their campaign; any "open rate" averages you see discussed on-line or in books are subject to the same rules.

It is difficult to estimate how much higher your real readership is, additionally the inaccuracy rate will vary from campaign to campaign. If we bear this in mind, we can still make some comparisons, for example "have I received more views over several campaigns" and "how to I compare to the industry average"

What's the difference?

The difference between the real open rate and the statistic may be very significant: in this case, a quick study found that only 1 in 3 of the customers who bought the cat food in the hours after the email was sent showed up in the open results, and the cat food offer was only advertised by email. In this case, the *real* open rate could be more like 80%.

Rate

To compare performance across several campaigns you can use the **RATE** statistic, which is the number of opens expressed as a percentage of the total sent. In this first campaign, we had an open rate of 25%.

Over time, as our list keeps growing, we can still compare back to see if we are keeping our subscribers interested. The rate statistic can also be used to:

- a/b test email titles and sending times
- to compare readership between lists
- and even to benchmark performance against industry averages.

Summary

This **Statistics Overview** page is useful for comparing and contrasting the success campaigns. This can help you to improve your future campaigns. However, the statistics should not be taken too literally.

GROWING AND USING COMPLEX LISTS

Understanding Subscribers and Lists

It is important to understand the nature of Subscribers and Lists in phpList.

What is a subscriber?

A subscriber is *usually* someone who is a member of one or more of your lists. They may have subscribed themselves through a subscribe page, or you may have imported their details from another source.

It is important to understand, however, that a *subscriber may not be on any list*. This happens when you:

- Import subscribers but do not assign them list membership
- Delete all the lists a subscriber was a member of (without deleting the subscriber)

What is a subscriber profile

All the data about a subscriber is stored in their subscriber profile.

This profile can be found by searching for their email in **Subscribers > Search Subscribers**. To see all subscribers search for @.

Here are some examples of the kind of data held in a subscriber profile:

On the **Details** page you can see information like ID, email address, confirmed or not, blacklisted or not, number of bounces and html or text emails. Some of this information is editable.

As you can see, the subscriber profile is the central place where all information about a subscriber is stored. This is very different to list membership.

What is a list?

A list is a way of grouping together subscribers so you can send them campaigns. However the list itself does not contain the subscriber details. As you have seen, all that information is in the subscriber profile.

You can view your lists by going to **Subscribers > Subscriber lists** from the main menu. Next to each list is the number of **MEMBERS** that list has.

SAVE CHANGES

However, if I delete the list, I have not deleted the subscribers.

Some examples of how this works in practice

A useful tool to help understand lists and subscribers is the **All subscribers** feature, which was added in version 3.0.8. When this feature is enabled (in the config.php file) you can see the total number of subscribers shown alongside your lists.

Let's do some experiments with adding and deleting lists to see what happens to the **All Subscribers** total.

At the start of our test, the number stands at **5327**. That means we have 5327 subscriber profiles in our system all together.

1 Lists

The screenshot shows the 'Lists' section of the MailChimp interface. There are two lists listed:

- All subscribers**: Shows 5327 members (1 active). A red box highlights this row.
- test**: Shows 1 member (1 active).

A large 'SAVE CHANGES' button is visible at the bottom left.

If we create a new list, and paste in the emails of some of our subscribers, we can add these subscribers to the list and send Campaigns to just a sub-section of our total number of subscribers.

The screenshot shows the 'Adding subscribers Just a list' dialog. It contains the following elements:

- Text: "Please enter the email addresses to import".
- Checkboxes:
 - Check to skip email addresses that don't exist
- Import emails** button.
- List of imported email addresses:
 - DemiDuffy@einrot.com
 - DanielAllen@armyspy.com
 - IsabelBrennan@rhyta.com
 - AliciaHussain@armyspy.com
 - OliviaJames@journapide.com
 - MasonCurtis@einrot.com
 - MohammadWalsh@fleckens.hu
 - SeanBartlett@superrito.com
 - OliviaHolden@einrot.com

The outcome is a new list (in this example with **662** members). However, you can see that the **All subscribers** total stays at **5327**. This is because we have not added any new subscribers, we have just created a list out of current subscribers.

2 Lists

The screenshot shows the 'Lists' section of the Mailchimp interface. It has two main columns: 'LISTS' and 'MEMBERS'. The 'LISTS' column contains three items: 'All subscribers', 'test', and 'Just a list'. The 'MEMBERS' column shows counts: '5327 (1)' for 'All subscribers', '1' for 'test', and '662' for 'Just a list'. Each list item has a green plus sign icon and a magnifying glass icon.

LISTS	MEMBERS
All subscribers	5327 (1)
test	1
Just a list	662

Now, if we delete the new list with its **662** members,

The screenshot shows the details for the 'Just a list' list. At the top, it displays 'Just a list' and '662' members. Below this are several icons: a trash can, a person icon, and a video camera icon. A button labeled 'delete this list' is highlighted with a black box. At the bottom left, there is a 'CHANGES' button.

the **All subscribers** count does not go down either, it is still **5327**.

deleting list 6 .. done

UNCATEGORISED

1 Lists

Lists

LISTS	MEMBERS
All subscribers	5327 (1)
test	1

We can repeat this test, but this time add a mixture of current subscribers (2) and new subscribers whose data we have never introduced to phpList before (8). You can see phpList processes all the lines, imports 8 new emails to the system and marks 2 as duplicates.

Subscribers Campaigns Statistics System Config Info

IMPORT SUBSCRIBERS BY COPY-AND-PASTE

10 lines processed
8 email imported
2 duplicates
0 invalidated

All of these emails are added to our new list, and additionally, our All subscribers count goes up by 8 subscribers to 5335.

2 Lists

The screenshot shows the 'Lists' section of the phpList interface. There are two lists listed:

- All subscribers: 5335 (1) members
- test: 1 member

A red box highlights the '5335 (1)' count for the 'All subscribers' list. At the bottom left is a 'SAVE CHANGES' button, and at the bottom center is an 'Add a list' button.

We have added 8 new subscribers to the system, and phpList has created 8 new subscriber profiles for us. If we delete our new list again...

The screenshot shows the 'Lists' section of the phpList interface after the 'test' list has been deleted. Only the 'All subscribers' list remains:

- All subscribers: 9 (1) members

A context menu is open over the 'test' list entry, with the option 'delete t...' highlighted. At the bottom left is a 'CHANGES' button.

The List is deleted, however the subscriber count stays at **5335**. We have only deleted a list, we have not deleted any subscribers.

deleting list 7 .. done

A red box highlights the '5335 (1)' cell in the 'All subscribers' row of the table.

How to delete subscribers

You should not delete subscribers in most circumstances. If a subscriber wants to stop receiving emails from you they can unsubscribe. Unsubscription means that:

- Their email will be kept on the system and added to a do-not-send list (blacklist)
- Your phpList system will never send a campaign to them again, unless they re-subscribe
- If you import their email again (by accident) you will not be able to send them campaigns inadvertently
- You have a record of when/why they unsubscribed which you can use to improve your campaigns in the future

If you are in a situation where you want to delete some subscribers rather than simply blacklist them, for example, to bring the size of your lists down, first try the options on the **Reconcile** page, for example to remove those with x number of bounces, those with an invalid email and those who are not-confirmed.

The final resort is to get some emails by exporting them (from **Export subscribers**) and then pasting whichever emails you wish to delete into the bulk delete function. This can be found through the **Manage Subscriber** page.

Creating your lists

In phpList you can organize your subscribers into **lists**. You must have at least one list. You may find that having multiple lists, that is, **Segmenting** your list, improves subscriber satisfaction and opens/clicks.

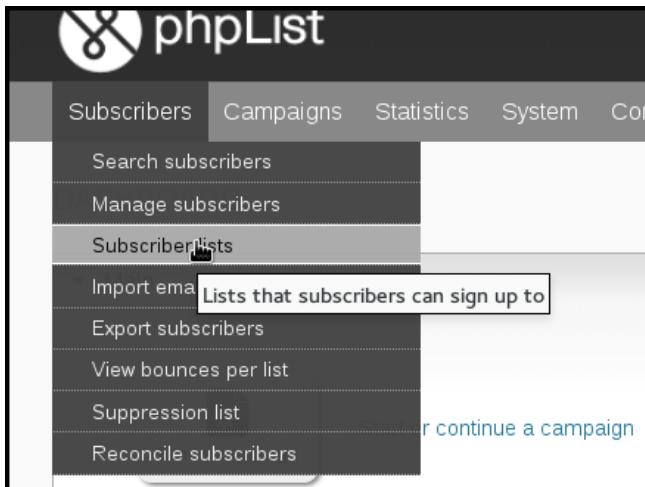

There are several factors to be aware of:

- You must select at least one list when sending
- You can select several lists or use the **all lists** function when sending
- Subscribers will never get the same campaign twice, even if they are on several of the lists you select
- Lists can be categorized to help you keep organized
- Lists are not the same as **Attributes**

Now that you know the basics, it's time to get started.

Go to your lists page

Go to **Subscribers > Subscriber lists** from the main menu.

This will take you to your **SUBSCRIBER LISTS** page, where all of your lists will be displayed.

There are two lists by default, **test** and **newsletter**.

You can view lists by category, or view lists which have no category by selecting **Uncategorized** from the dropdown menu.

List Description

List Name

This will help you to keep your lists organized and remember what the list is for. If your list is public this name will be displayed on your subscribe pages. If your list is private, the name will be known only to you (and possibly to other people who manage your phpList installation).

Public List

The **Public List** box should be checked when

- You want subscribers to be able to add themselves to the list using a subscribe page

- You want subscribers to be able to leave this individual list (but stay on others)
- You have chosen a list name and description which you are happy to display publicly

If you do not make the list public, it is considered private, and it will not be seen by your subscribers.

Category

Categories can be used to help organise your lists. If you decide to use them there is lots of information in the categories chapter, however, here is a summary:

- If you have no categories then the category dropdown will not display on this page
- You *must* use categories if you have more than 16 lists
- If you have some categories already but you want to leave this list uncategorised then simply leave -- **Choose category** in the dropdown

In this instance we had already set up some categories and chose the category **Gardening** from the dropdown.

List Description

This information will display on your subscribe pages if the list is public.

Save and repeat

When you have filled out the page click **Save**. You can come back and edit the info again later if you need to. You can create as many lists as you need.

You will be prompted to add some subscribers to the list. See the next chapters for more guidance.

Adding Subscribers (to Lists)

There are three main ways to add subscribers to your phpList installation:

- copy and paste a list of emails
- upload a file with emails
- upload a CSV file with emails and additional data.

The screenshot shows the 'Subscribers' section of the phpList interface. At the top, there are tabs for Subscribers, Campaigns, Statistics, System, Config, and Info. Below the tabs, the title 'IMPORT EMAILS' is displayed. A message says 'Please choose one of the import methods below'. Three options are listed in boxes:

- copy and paste list of emails (represented by a clipboard icon)
- import by uploading a file with emails (represented by a file icon with a downward arrow)
- import by uploading a CSV file with emails and additional data (represented by a CSV file icon with a downward arrow)

This chapter deals with each of these methods in three stages

- When and why you might use the import method
- Preparing your data
- Importing your data

Why is (to lists) in brackets?

It is important to remember that:

- Subscribers can exist on the system without being a member of any list
- In this chapter is assumed that you will be adding subscribers in the form of a list, but you can add them without making/choosing a list if you want to

- When you add a subscriber to the system for the *first* time, a subscriber profile is created
- Adding the subscriber to more lists does not create more profiles, all the subscriber details are saved in one profile no matter how many lists the subscriber is on
- Deleting the list does not delete the subscribers.

You can read the chapter about the difference between subscribers and lists for more information.

Copy and pasting

Why and when to use this method

If your data is very simple, just a long list of emails in a paper or digital document, then this could be the method for you - especially if you are not very confident with file formats.

If the emails are on paper then you could type them directly into the import dialogue, however, it is probably better to type them into a document first.

This is also the method you will use when you create a new list from subscribers that are already on your system.

Preparing your data for this method

Preparation for copy and pasting the emails in is minimal. You may need to do nothing at all.

If your emails are in a text file or a word-processing file, you need to open the file with the emails in, and make sure the data is just a list of emails, one on each line and with no punctuation.

If your emails are in a spreadsheet or csv file you do not need to prepare them. However, if this is the first time you will be adding the subscribers to the system you may wish to use a csv import to allow you to add more of your data to their subscriber profiles.

Importing your data

If your data set consists of a list of emails in a file, like this:

A screenshot of a text editor window titled "emails.txt". The menu bar includes File, Edit, View, Search, Tools, and Documents. The toolbar contains icons for Open, Save, Undo, and Redo. The main text area displays a list of email addresses, each on a new line. The list starts with "KayleighHopkins@jourrapide.com" and continues through "PeterJoyce@gustr.com". At the bottom of the window, there are status indicators: "Plain Text", "Tab Width: 8", "Ln 2, Col 21", and "INS".

```
KayleighHopkins@jourrapide.com
FinleyMay@einrot.com
KatieHughes@gustr.com
AbbieDaniels@rhyta.com
EloiseSimmons@einrot.com
SophiePreston@jourrapide.com
JadeBrennan@einrot.com
NaomiThornton@einrot.com
AlfieKnight@armyspy.com
MeganRead@einrot.com
GabrielDaniels@superrrito.com
FinlayBolton@superrrito.com
GeorginaRichardson@gustr.com
JosephForster@einrot.com
LucyColeman@cuvox.de
TillyFaulkner@cuvox.de
WilliamMoss@superrrito.com
CourtneyBradley@rhyta.com
PeterJoyce@gustr.com
```

Or a complex data set in a spreadsheet like this, from which you only wish to upload the emails

	A	B	C	D	E
1	ID	Title	GivenName	Surname	EmailAddress
2	1	Ms.	Kayleigh	Hopkins	KayleighHopkins@jourrapide.com
3	2	Ms.	Mia	Gilbert	MiaGilbert@jourrapide.com
4	3	Mr.	Finley	May	FinleyMay@einrot.com
5	4	Mrs.	Katie	Hughes	KatieHughes@gustr.com
6	5	Ms.	Abbie	Daniels	AbbieDaniels@rhyta.com
7	6	Mrs.	Eloise	Simmons	EloiseSimmons@einrot.com
8	7	Ms.	Sophie	Preston	SophiePreston@jourrapide.com
9	8	Mrs.	Jade	Brennan	JadeBrennan@einrot.com
0	9	Ms	Naomi	Thornton	NaomiThornton@einrot.com

Then first you need to select them in your document and copy them. This is often done by pressing:

- **Control+C** or
- **Right click > Copy** or

- **Edit > Copy.**

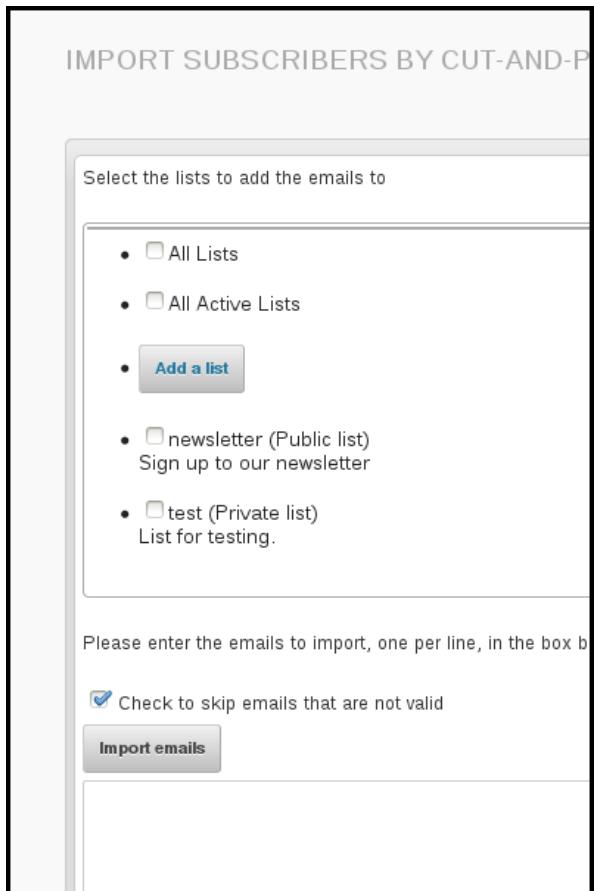

Then go to **Subscribers > Import emails** from the main menu

Click the **copy and paste list of emails** button in phpList

A screenshot of the 'IMPORT EMAILS' page. The heading says 'IMPORT EMAILS' and below it, a message says 'Please choose one of the import methods below'. There are two main options: 1) 'copy and paste list of emails' represented by a yellow button with a clipboard icon and a 'copy' icon. 2) 'import by uploading a file with emails' represented by a grey button with a file icon and a 'cut-and-paste' icon. The 'copy and paste list of emails' button is highlighted with a white box around it.

You will then see the following page:

First choose a list by ticking the box next to the list name.

You may also **Add a list**, or tick **All Lists**. Also, it is best to leave the **Check to skip emails that are not valid** box ticked. Next, paste your emails into the box, using

- **control+v**
- Or **right click** and **Paste**.

- [Add a list](#)
- newsletter (Public list)
Sign up to our newsletter
- test (Private list)
List for testing.

Please enter the emails to import, one per line, in the box below and click the Import emails button.

Check to skip emails that are not valid

Upload a file with emails

Why and when to use this method

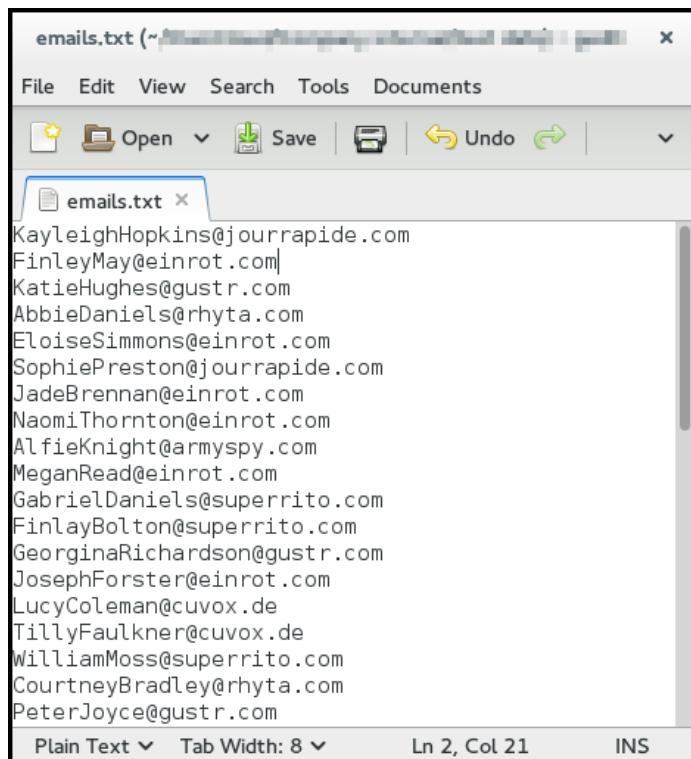

If you have a digital list of emails with no other data, and you know how to save them as a text file, then this is the right method for you.

If you have more than just emails in the file and you want to upload all of the information, you will need to use the CSV import.

Preparing your data

Your file needs to be formatted:

- One email per line
- No spaces, tabs, commas etc.
- You need to save it as plain text (filename.txt)
- You should only edit it in a text editor such as NotePad,TextEdit or Geany.

The screenshot shows a text editor window titled "emails.txt". The menu bar includes "File", "Edit", "View", "Search", "Tools", and "Documents". The toolbar contains icons for "Open", "Save", "Undo", and "Redo". The main text area displays a list of email addresses:

```
KayleighHopkins@jourrapide.com
FinleyMay@einrot.com
KatieHughes@gustr.com
AbbieDaniels@rhyta.com
EloiseSimmons@einrot.com
SophiePreston@jourrapide.com
JadeBrennan@einrot.com
NaomiThornton@einrot.com
AlfieKnight@armyspy.com
MeganRead@einrot.com
GabrielDaniels@superrrito.com
FinlayBolton@superrrito.com
GeorginaRichardson@gustr.com
JosephForster@einrot.com
LucyColeman@cuvox.de
TillyFaulkner@cuvox.de
WilliamMoss@superrrito.com
CourtneyBradley@rhyta.com
PeterJoyce@gustr.com
```

At the bottom of the editor, there are buttons for "Plain Text", "Tab Width: 8", "Ln 2, Col 21", and "INS".

It is still possible to import this data when there is additional information after the email, for example:

FinelyMay@einrot.com age 23 from Southport likes chips with curry sauce

But, everything after the end of the email will be discarded. Additionally, if you have any punctuation attached to the end of the email, for example,

FinelyMay@einrot.com, age 23 from Southport likes chips with curry sauce

then the data will be corrupted because the comma at the end of the email address will be imported as part of the email.

Importing your data

Go to **Subscribers > Import emails** from the main menu

Click **Import by uploading a file with emails**.

The dialog box has a title 'IMPORT EMAILS' and a subtitle 'Please choose one of the import method'. It contains three options:

- 'copy and paste list of emails' (with a clipboard icon)
- 'import by uploading a file with emails' (with a file icon and a hand cursor icon over it, indicating it is selected)
- 'import by uploading a CSV file with emails and additional data' (with a CSV icon)

You will then see the **Import Subscribers From Text File** page.

IMPORT SUBSCRIBERS FROM TEXT FILE

Select the lists to add the emails to

- All Lists
- All Active Lists
- [Add a list](#)
- newsletter (Public list)
Sign up to our newsletter

You will see the emails importing.

Upload a CSV file: emails and some additional information

Why and when to use this method

This is the method used when you have a spreadsheet full of data, where there might be names, emails, addresses... Often this data will have been exported from another source, such as a CMS, CRM, webshop, database or email address book.

If you have such data, it is a good idea to upload a CSV file the first time you add subscribers to the system and you are asked to make a list (even though you will only be prompted to copy and paste). From then on, unless you need to re-synchronise or add some new data, you can just use copy and paste to add subscribers to lists.

Preparing your data

When you have emails and some additional information, such as Name and Gender, you need to

- Open the data in a spreadsheet
- Rename some columns to avoid or utilise phpList system values
- Save as a csv - make a note of the delimiter.

Example Dataset for CSV Import

In this example we have ID, title, first name, email address, height in cm and gender, and they are stored in a spreadsheet format (xls, ods or similar).

	A	B	C	D	E
1	ID	Title	GivenName	Surname	EmailAddress
2	1	Ms.	Kayleigh	Hopkins	KayleighHopkins@jourrapide.com
3	2	Ms.	Mia	Gilbert	MiaGilbert@jourrapide.com
4	3	Mr.	Finley	May	FinleyMay@einrot.com
5	4	Mrs.	Katie	Hughes	KatieHughes@gustr.com
6	5	Ms.	Abbie	Daniels	AbbieDaniels@rhyta.com
7	6	Mrs.	Eloise	Simmons	EloiseSimmons@einrot.com
8	7	Ms.	Sophie	Preston	SophiePreston@jourrapide.com
9	8	Mrs.	Jade	Brennan	JadeBrennan@einrot.com
0	9	Ms.	Naomi	Thornton	NaomiThornton@einrot.com

Data that includes an ID

When you use another application, a blog, webstore, CRM software etc, you may want to keep the data in phpList synchronized with the data in your other app.

phpList allows you to do this accurately by using a **foreign key**: this means that the ID tag or number used to identify an individual in your other application can also be used to identify a the subscriber in phpList. This means that:

- If a subscriber's email address changes in your other app, this can be updated in phpList

- Any changes to subscriber attributes can be updated automatically, for example surname, location, date of last purchase from your store.

If you wish to use the ID as a foreign key you should rename the column ID (or similar) to **foreign key**.

Renaming columns to avoid phpList system values

Some words are already used by phpList to describe data: these are called phpList **system values**. phpList will not allow you to import data from columns in your CSV when certain system values are used as a column title. These columns will simply be **skipped** when you try to import.

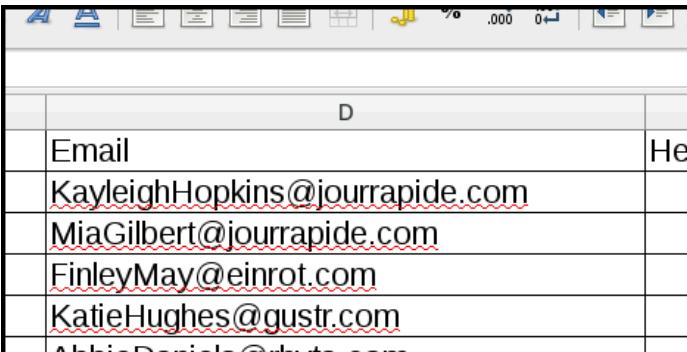

It is common for other software and web applications to use the same system values. Columns must be renamed before the data exported from one app can be imported into phpList. Here are some examples (a full list can be found later in the chapter):

- ID
- confirmed
- passwordchanged

Renaming columns to match phpList system values

Some columns can be renamed to *match* phpList system values, because those system values are designed to take imported data.

In the example below we rename the column **Email address** to **Email**. It is possible to achieve the same thing during import by mapping one term to another.

A screenshot of a spreadsheet application showing a list of email addresses. The top row contains column headers and various icons. Below this, there are five rows of data, each containing an email address. The first row has 'Email' in the first column and 'He' in the last column. The subsequent four rows have email addresses under the 'Email' header. All email addresses are underlined with red, indicating they are being edited or are errors.

	D	
Email		He
KayleighHopkins@jourrapide.com		
MiaGilbert@jourrapide.com		
FinleyMay@einrot.com		
KatieHughes@gustr.com		
AbbieDaniels@rbvta.com		

As another example, the **ID** column can be renamed to **Foreign Key**. This allows the data to be put to use in phpList when otherwise it would just be skipped. In this case, phpList would not allow you to map ID to Foreign key during import so this task must be done before upload.

A	B	C	D	E
Foreign Key	Title	GivenName	Surname	Email
1	Ms.	Kayleigh	Hopkins	KayleighHopkins@jourrapide.co.uk
2	Ms.	Mia	Gilbert	MiaGilbert@jourrapide.co.uk
3	Mr.	Finley	May	FinleyMay@einrot.com
4	Mrs.	Katie	Hughes	KatieHughes@gustr.co.uk
5	Ms.	Abbie	Daniels	AbbieDaniels@rhyta.co.uk
6	Mrs.	Eloise	Simmons	EloiseSimmons@einrot.com
7	Ms.	Sophie	Preston	SophiePreston@jourrapide.co.uk
8	Mr.	Iando	Brannon	IandoBrannon@einrot.com

A list of system values

Here is a table containing a list of all the system values and how phpList will deal with columns with that name if you try and import them.

List of system values and how phpList will respond if they are column names.

id	Will be skipped
email	Will import
confirmed	Will be skipped
blacklisted	Will be skipped
optedIn	Will import
bounceCount	Will be skipped
entered	Will be skipped
modified	Will be skipped
uniqueID	Will be skipped
htmlEmail	Will import
subscribePage	Will be skipped
rssFrequency	Will be skipped
password	Will import

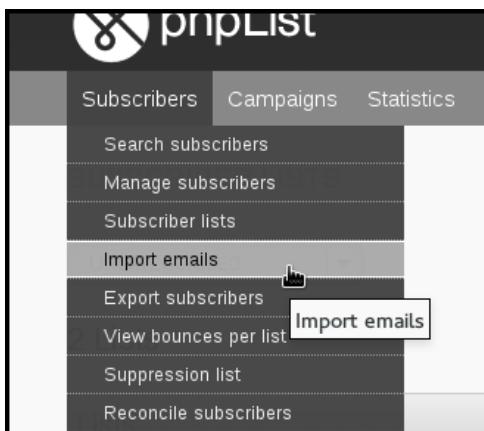

passwordchanged	Will be skipped
disabled	Will import
extradata	Will import (as attribute)
foreignkey	Will import
unique_1 (2, 3 etc) or index_1 (2, 3 etc)	Will be skipped

Saving the file

Next we need to save the file as a **CSV** file, a comma separated value file. You should *ideally* change the delimiter to tab. If it is not tab, you will at least need to be aware of what the delimiter is so you can tell phpList when you import.

Importing the subscribers

First go to **Subscribers > Import emails** from the main menu.

Click the final option for **import by uploading a CSV file with emails and additional data**.

Please choose one of the import methods below

copy and paste list of emails

import by uploading a file with
emails

import by uploading a CSV file
with emails and additional data

Import subscribers from CSV file

You will then see the **Import Subscribers From CSV Page**.

IMPORT SUBSCRIBERS FROM CSV FILE

Select the lists to add the emails to

- All Lists
- All Active Lists
- **Add a list**
- newsletter (Public list)
Sign up to our newsletter
- test (Private list)
List for testing.

First choose a list by ticking the box next to it. You may also choose **All Lists** or **Add a list**.

Next upload your CSV file by clicking **Browse...**, choosing the file on your pc and clicking **Save**.

A screenshot of a CSV file upload interface. It shows a file path "C:\Users\...\" followed by "foreign key is 100. Warning: the file needs to be plain text. Do not", a "File containing emails:" input field, a "Browse..." button with the file name "emails.csv", and a note about file size limits ("The following limits are set by your Maximum size of a total data sent to us is 10MB. Maximum size of each individual file is less than 5MB"). Below this, a "Field Delimiter:" input field contains a comma (,), with the note "(default is TAB)" underneath. A note at the bottom says "If you check "Test Output", you will get the list of parsed emails on the screen below this message. This is useful for finding errors in the file.".

You must also indicate the delimiter, this is what separates each item in your CSV (in place of the column lines). If you are unsure what the delimiter of your file is, you can open the file into a plain text editor such as Notepad. You will see what is separating the items. In this case it is a comma, so we put a **,** in the **Field Delimiter** box.

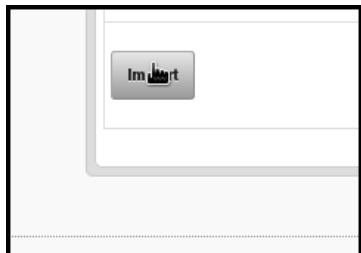

A screenshot of a CSV file content. The data consists of 10 rows, each containing a foreign key, title, first name, last name, and email address. The columns are labeled "Foreign Key", "Title", "Given Name", "Surname", and "Email".

Foreign Key	Title	Given Name	Surname	Email
1	Ms.,	Kayleigh	Hopkins	KayleighHopkins@journrapide.com
2	Ms.,	Mia	Gilbert	MiaGilbert@journrapide.com
3	Mr.,	Finley	May	FinleyMay@einrot.com
4	Mrs.,	Katie	Hughes	KatieHughes@gustr.com
5	Ms.,	Abbie	Daniels	AbbieDaniels@rhyta.com
6	Mrs.,	Eloise	Simmons	EloiseSimmons@einrot.com
7	Ms.,	Sophie	Preston	SophiePreston@journrapide.com
8	Mrs.,	Jade	Brennan	JadeBrennan@einrot.com
9	Ms.,	Naomi	Thornton	NaomiThornton@einrot.com
10	Mr.,	Alfie	Knight	AlfieKnight@armyspy.com

There are various other options on this page, which all have a description. Generally, it is good to keep the **Test Output** option checked.

Use the **Overwrite existing** and/or **Retain old email** options to preserve the data set which should be held safe; it is the source of most up-to-date data.

When you have finished filling out this form, click **Import**.

You will now see a page where you can match the data in your file to attributes on the system. Attributes such as **Foreign Key** and **Email** will not appear on this page because the system deals with them automatically: all the attribute on this page are new to the system.

IMPORT SUBSCRIBERS FROM CSV FILE

Reading emails from file ... ok, 13 lines

Please identify the target of the following unknown columns

Import Attributes

IMPORT ATTRIBUTES	SELECT
Title	-- Create new one
GivenName	-- Create new one
Surname	-- Create new one
Centimetres	-- Create new one

Click on each dropdown - is the correct attribute already in the list? If not, select **Create new one**. This will create a new attribute in your phpList so that next time you import similar data the system can deal with it automatically.

Import Attributes

IMPORT ATTRIBUTES		SELECT
Title		-- Create new one
GivenName		-- Create new one -- Skip Column Send this subscriber HTML
Surname		RSS Frequency Password Is this account disabled?

Problem? If you see something like the image below, where all your attributes are on one line, then you have used the wrong delimiter.

Please identify the target of the following unknown columns

Import Attributes

IMPORT ATTRIBUTES	SELECT
Foreign Key,Title,GivenName,Surname,Email,Centimetres,Gender	-- Create new one

CONTINUE

You will also see some test data, that will give you a strong indication of whether your import is going well. Each column title from your csv should line up with some data about one of your new subscribers.

12 lines will be imported

Confirm Import

Test Output

```
email -> KayleighHopkins@jourrapide.com  
foreignkey -> 1  
htmlemail -> 1  
Title -> Ms.  
GivenName -> Kayleigh  
Surname -> Hopkins  
Centimetres -> 158  
Gender -> female
```

Problems?

If you see anything wrong in the test, *do not proceed!* Click the Reset import session button to start again, check your delimiter settings and/or get help. A messy import is *no fun to fix!*

When all attributes have been dealt with and you are happy with your test data, click **Continue**.

A screenshot of a software interface. At the top, there is a header bar. Below it, a large text input field contains the word "Gender". At the bottom of the screen, there is a grey rectangular button with the word "CONTINUE" in white capital letters. To the right of the word "CONTINUE" is a small icon of a person walking.

You will be shown a summary of what will happen when you import. Now you can see that **Foreign Key** and **Email** are matched automatically, and all your other attributes will be created for you.

IMPORT SUBSCRIBERS FROM CSV FILE

If you are satisfied, click **Confirm Import**.

IMPORT SUBSCRIBERS FROM CSV FILE

Reading emails from file ... ok, 13 lines

Importing 12 subscribers to 1 lists, please wait

12 emails successfully imported to the database and added to 1 lists.
12 emails subscribed to the lists
12 duplicate emails found.
Subscriber data was updated for 12 subscribers
12 subscribers were matched by foreign key, 0 by email

Import some more emails

You will see that your subscribers and their data has been imported.

Creating a subscribe page

A subscribe page usually consists of a short form that a visitor to your website can fill out to subscribe themselves to one or more of your lists. Here is an example:

The screenshot shows a subscribe page titled "Ethical Pets". The page has a dark header bar with the title. Below it is a white form area. At the top of the form, there is a message: "Subscribe to updates from Ethical Pets: news, reviews and special offers.". A note below the message says "REQUIRED FIELDS ARE MARKED RED". The form contains four input fields: "Email address" (marked red), "Confirm your email address" (marked red), "Last name" (unmarked), and "First name" (unmarked). There is also a checkbox labeled "I prefer to receive emails in Text format" which is checked. Below the form is a button labeled "Subscribe to the selected newsletters". At the bottom of the page, there is an "Unsubscribe" link and a "POWERED BY phplist" logo.

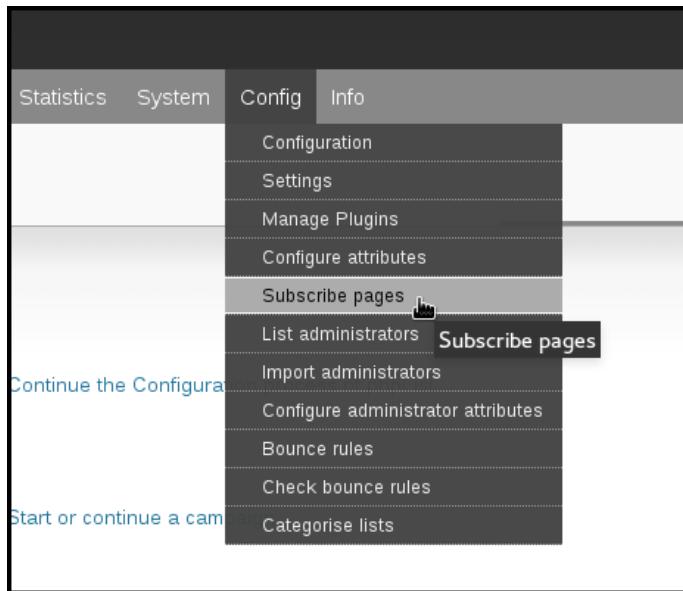

In the example above, the subscriber is asked to input their email address and to confirm it. They can then choose to receive a text version format and they can add their first and last names if they wish.

In phpList you can have an unlimited number of pages, combining any set of Attributes, Lists and Languages.

Additionally you can use pages in conjunction with scripts to create subscribe forms which integrate more closely with your website. As this is a custom-made process for individual sites we do not have generic documentation about it.

Create a page

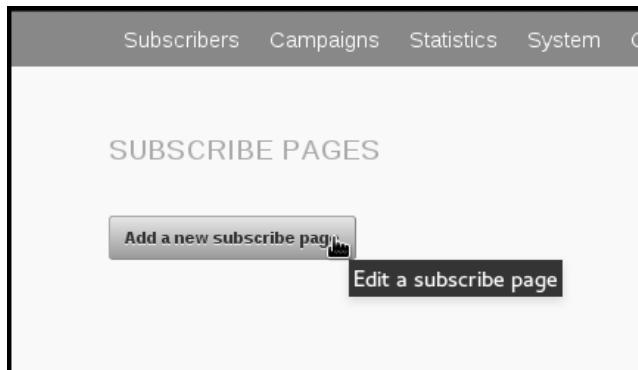

To get started with your subscribe page visit **Config > Subscribe Pages**.

Initially you'll find this page empty, with no subscribe pages to display, although there is a default subscribe page at www.yourdomain.com/lists.

The first page you make will replace this default page and later you can set any page as default.

To create a new page click **Add a new subscribe page**.

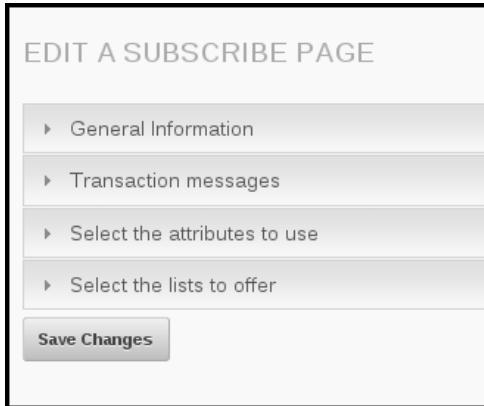

This will open a page called **EDIT A SUBSCRIBE PAGE**.

Customize a Subscribe Page

The subscribe page editor is broken into four collapsible areas:

- **General information**
- **Transaction messages**
- **Select the attributes to use**
- **Select the lists to offer**

These sections will guide you through creating a subscribe page which meets your specific needs.

General information

The first box edits the titles and text on the page. Enter your title in the **Title** box first of all.

You can leave **Language file to use** as **--default**, unless you are creating a page for a language other than the one you use for your installation, for example, if you are creating a multi-lingual system.

EDIT A SUBSCRIBE PAGE

▼ General Information

Title

The Ethical Pets Gazzette

Language file to use

--default ▾

Intro

<h3>Subscribe to our newsletters</h3>

Header

You can change the text in the intro too.

--default ▾

Intro

<h3>Subscribe to updates from Ethical Pets; news, reviews and special offers</h3>

The **Header** and **Footer** dialogues are used for html editing, and the default code in them is taken from **Config > Settings > subscription-ui settings**. We will discuss this further in the Subscribe page design and configuration chapter.

You can edit the text in the **Thank you page** and **Text for button** too, however, the standard texts are suitable for most situations so you may wish to just leave the defaults as they are.

General Information: HTML or Text

The last section of the general information sections is on **HTML Email choice**. It is very important and it directly affects the quality of your lists and the subscribe satisfaction.

You can create a HTML email in phpList, with images and other design elements, and also a plain text version, with just text, no images, colours etc. Some subscribers prefer only text, they may want plain text for technical reasons, for example for compatibility with assistive software for a visual impairment, or it may simply be a personal preference.

If you are planning on sending HTML messages you will want to avoid large numbers of your subscribers accidentally signing up for text only emails. You will have wasted time on a design they will never see and they may be less interested in your mails.

It is therefore worth spending time on this section, deciding how you would like to present the text vs. HTML options.

The default (as of version 3.0.11) is **Offer checkbox for text**, where the box defaults to unchecked on the subscribe page. This means your subscribers will have to manually choose to receive text emails, but the option is there for those who need/want it.

<p>HTML Email choice</p> <ul style="list-style-type: none"><input type="radio"/> Don't offer choice, default to text<input type="radio"/> Don't offer choice, default to HTML<input checked="" type="radio"/> Offer checkbox for text<input type="radio"/> Offer checkbox for HTML<input type="radio"/> Radio buttons, default to text<input type="radio"/> Radio buttons, default to HTML <p>Display Email confirmation</p> <ul style="list-style-type: none"><input checked="" type="radio"/> Display email confirmation<input type="radio"/> Don't display email confirmation
--

If you intend to send emails in HTML format it is best to make the "path of least resistance" be the signup for HTML. Many subscribers will ignore the box, or may not know what HTML vs. text means.

Transaction messages

These are the messages sent to the Subscriber based on various actions, such as subscribe and unsubscribe. The defaults are taken from **Config > Settings > transactional settings**. It is possible to edit these, although the defaults are suitable for most situations.

Select the attributes to use

This section allows you to choose which attributes, which personal/demographic data, you will ask for from your subscribers on the page.

You might ask for generic information like name and city, or something more specific, like shoe size or hobbies. The use of attributes is described in the Attributes and Placeholders chapters.

In this example we collected **First Name** and **Last Name** only and we did not make either of them **required** because many people do not wish to give out personal information. We had several other attributes to choose from.

The screenshot shows a configuration interface for selecting attributes. At the top, there is a header bar with the title 'Transaction messages'. Below the header, a section titled 'Select the attributes to use' is expanded. This section contains two attribute definitions, each with a checkbox labeled 'Check this box to use this attribute in the page'.

Attribute:	Name:	Type:	Default Value:	Order of Listing:	Is this attribute required?:
Attribute: 1	First name	textline			<input checked="" type="checkbox"/>
Attribute: 2	Last name				<input type="checkbox"/>

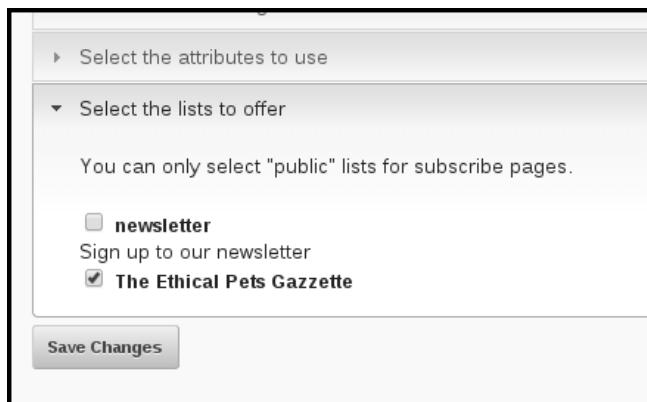

The **Type**: is defined in the attributes editor. The **Default value** can be different on each subscribe page if needed.

*Please note that if a customer does not change the **Default value** when they subscribe, whatever you set it as here will be added to your database.*

Select the lists to offer

This final section allows you to select which lists to offer.

If you select only one list, then the subscriber will not be given a choice. If you select multiple lists, then the subscriber will be able to select which lists they want to join. In this example we chose only one list.

Save your new page

Click the Save button at the end of the page when you are ready. You will be able to edit the page again later if you want to make a change.

You will then be directed back to your Subscribe Pages list. We can now see one page.

SUBSCRIBE PAGES

subscribe pages

SUBSCRIBE PAGES	TITLE	OWNER	DEFAULT	ACTIVE
1	The Ethical Pets Gazzette	admin	<input checked="" type="radio"/>	<input checked="" type="checkbox"/>

View your page

To view your new subscribe page click the magnifying glass icon next to it on your **subscribe pages** list (**Config > Subscribe pages** from the main menu).

A screenshot of a software interface showing a list of 'SUBSCRIBE PAGES'. There is one item listed: 'Gazzette' by 'admin'. The 'View' button, which has a magnifying glass icon, is highlighted with a black box. To the right of the list, there is a vertical sidebar with various menu items: NAME, DATA, help, ALL, LOCATIONS, CATEGORIES, SETTINGS, and M...

	OWNER	DEFAULT	ACTIVE
Gazzette	admin	<input checked="" type="radio"/>	<input checked="" type="checkbox"/>

Your page will look something like this:

Ethical Pets

Subscribe to updates from Ethical Pets: news, reviews and special offers.

REQUIRED FIELDS ARE MARKED RED

Email address

Confirm your email address

I prefer to receive emails in Text format

Last name

First name

[Unsubscribe](#)

POWERED BY
 phplist

Use your page to add a subscriber as an admin

One additional functionality of the subscribe page view is to add a subscriber to your database quickly, without needing to go into the administrative interface. If you view the subscribe page while logged in as an administrator, you will see an additional box:

Subscribe to updates from Ethical Pets: news, reviews and special offers.

REQUIRED FIELDS ARE MARKED RED

 You are logged in as administrator (admin) of this phpList system

You are therefore offered the following choice, which your subscribers will not see when they load this page.

Please choose:

Make this subscriber confirmed immediately

Send this subscriber a request for confirmation email

Email address

This box allows you to add a subscriber by filling out the form on their behalf, and you can specify if you need to send them a confirmation request or not. This can be useful if you are talking to the new subscriber on the phone, for example.

Setting up your List Categories

When you have more than a handful of lists you will need to organize them into categories. You will be prompted to do this once you create more than 16 lists.

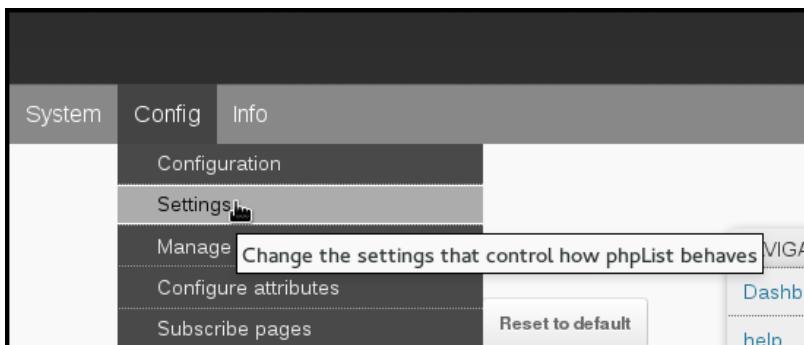

You can create categories to help you organize your lists at any time, and so the exact method you should use depends on your situation. In this chapter there are two suggested workflows.

1. Categories are set up before any lists are made (**categories before lists**).
2. Categories are set up to help organize pre-existing lists (**lists before categories**).

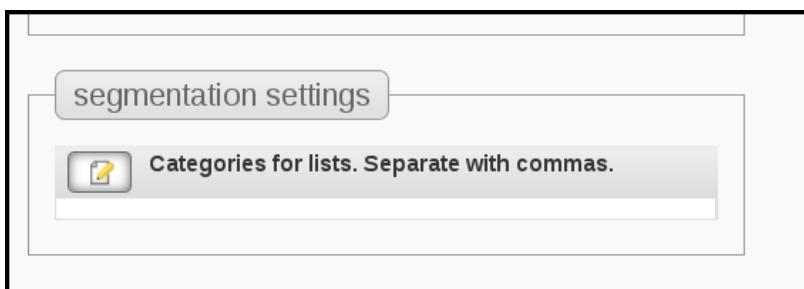

You should follow the section most appropriate to your situation.

Categories before lists

To create your categories go to **Config > Settings**

Scroll down until you find **Segmentation settings**

Enter the names of your categories, separated by a comma.

In the image above you can see I have made a list category called **veganism**, for example. This is because I know I will have several lists about veganism in the future, for example, recipes, campaigning, events and philosophy.

*NEXT, See the section about **Using categories** at the bottom of the page.*

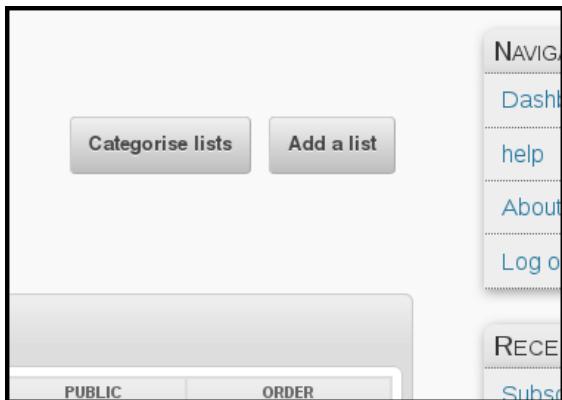

Lists before categories

If you use phpList a lot and you are using list segmentation you will soon end up with more lists than you can easily manage without categorising. To start categorising your lists go to **Subscribers > Subscriber lists**.

The screenshot shows the phpList :: Subscriber lists interface in Mozilla Firefox. The window title is "phpList :: phpList :: Subscriber lists – Mozilla Firefox". The menu bar includes File, Edit, View, History, Bookmarks, Tools, and Help. The toolbar includes standard browser buttons like back, forward, search, and refresh. The main content area displays a list of subscriber categories:

Category	Action Icons	Count
Eco Gardening	[magnifying glass] [checkmark] [0] [trash] [plus sign] [video camera] [pencil]	0
Vegan Events	[magnifying glass] [checkmark] [0] [trash] [plus sign] [video camera] [pencil]	0
Vegan Philosophy	[magnifying glass] [checkmark] [0] [trash] [plus sign] [video camera] [pencil]	0
Free Software Events	[magnifying glass] [checkmark] [0] [trash] [plus sign] [video camera] [pencil]	0
Free Software Philosophy	[magnifying glass] [checkmark] [0] [trash] [plus sign] [video camera] [pencil]	0

Then click **Categorise lists**.

If you have no categories at all yet, you will see the following screen:

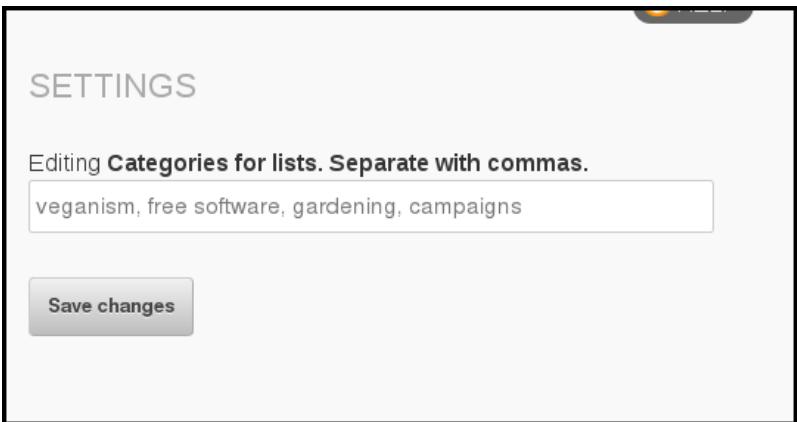

A screenshot of a web application interface titled 'CATEGORISE LISTS'. The main content area displays the message 'No list categories have been defined'. Below this message is a text block: 'Once you have set up a few categories, come back to this page to classify your lists with your categories.' At the bottom left of the content area is a button labeled 'Configure categories'.

Click **Configure categories**.

*If you already have a few categories you will see a similar screen with the **Configure categories** button (which you still must click) in the top right.*

Create your categories

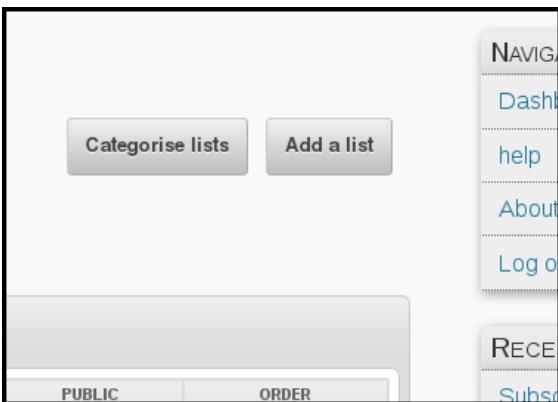

Add your categories, one by one, with commas between them.

Click **Save Changes**.

Add lists to categories

Go back to **Subscribers > Subscriber lists**. Click the **Categorise lists** button.

Select the correct category from the drop-down beside each list.

If a list is already categorized, it will not be displayed.

3	Vegan Recipes	veganism
4	Eco Gardening	-- Choose category
5	Vegan Events	veganism free software gardening campaigns -- Choose category
6	Vegan Philosophy	-- Choose category

Carry on till all the lists are matched with a category if possible.

5	Vegan Events	veganism
6	Vegan Philosophy	veganism
7	Free Software Events	free software
8	Free Software Philosophy	free software
9	Grow your own food	gardening
10	Free Software - Technical	free software

If you find a list that does not fit into a category you can keep it in **Uncategorized** by leaving **--Choose category** in the dropdown and make a new category later.

When you have finished click **Save**. Then, if you want to create more categories click the **Configure categories** button at the top of the page again and repeat the cycle.

If a list has already been categorised and you want to change the category, you can do this by editing the list from the main lists page.

Using your categories

Once you have finished setting up categories, they should become part of your everyday workflow with phpList.

For example, when you make a new list, you can assign it to a category during the creation stage. In this image I have created a list called Vegan Recipes and I can categorize it under veganism.

EDIT A LIST

- Vegan Recipes (Private list)

Using Attributes

phpList is pre-configured to deal with some data about your subscribers, for example email address, number of bounces (bouncecount) and their phpList ID number: these are called **system values**. **Attributes** are used for any other data you want to add to the system about your subscribers, usually demographic information.

Some common attributes are Name, Age, Gender and City. Some bespoke examples could be height, annual income, names of pets or kids and favourite genre of book. The attributes you use are entirely up to you to decide.

Once you have collected/uploaded attribute data, it can be used to connect to your subscribers more directly and with better precision, by using **placeholders** and the **segment plugin**.

There are two ways to create attributes:

- Create them in bulk when you import a csv file
- Create them manually from the configure attributes page
- Edit them from the configure attributes page

This chapter will explain how to create attributes. How to use them is covered by the placeholders chapter and the segment plugin documentation.

Creating Attributes when importing data

When you import complex data using the "csv with additional data" method, attributes can be easily created (in bulk) from column titles which are not already listed as an attribute.

Do not create new attributes for email and other system attributes, you must map those to the pre-existing system attributes listed in the dropdown.

In the image below, five new attributes are being created, and **EmailAddress** is mapped to **Email**.

Surname and **Gender** are standard attributes, however, the subscribers' height in **Centimetres** is more unusual. phpList treats all these attributes in the same way: there are no restrictions on the subject matter of an attribute.

Import Attributes

IMPORT ATTRIBUTES	SELECT
Title	-- Create new one ▾
GivenName	-- Create new one ▾
Surname	-- Create new one ▾
EmailAddress	Email ▾
Centimeters	-- Create new one ▾
Gender	-- Create new one ▾

CONTINUE

Once an attribute has been created, any column headed with the attribute name in future csv files you import will be mapped to the attribute automatically. You will not need to create the attribute again.

SUMMARY	MAPS TO
EmailAddress	system: email
Title	Title
GivenName	GivenName
Surname	Surname
Centimeters	Centimeters
Gender	Gender

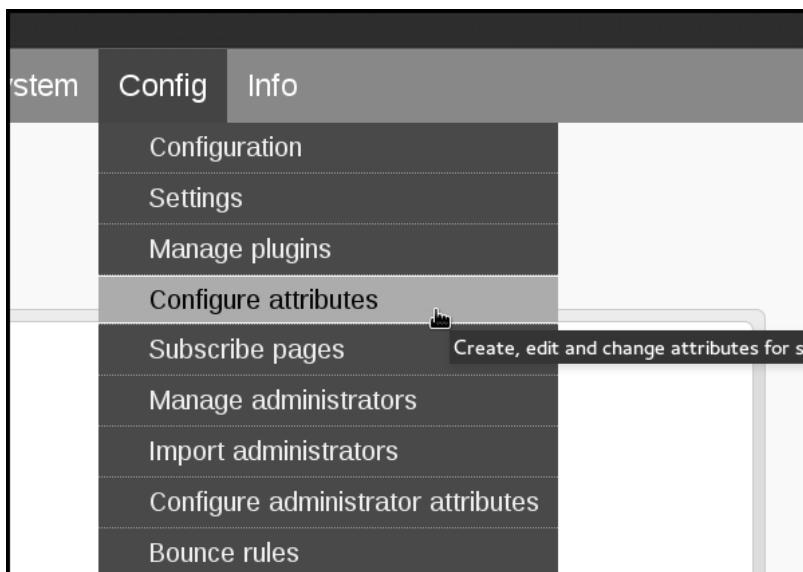

If there is new data for a pre-existing subscriber, it will be integrated into the subscriber details by using email address or Foreign Key as a reference.

In the image below, for example, we have subscribers on the system already, and now have added ShoeSize as a new attribute. Where our new dataset provides a shoe size for a pre-existing subscriber, this new attribute data is simply added to the details.

The image shows two side-by-side subscriber edit forms. The left form has fields for Title (Ms.), GivenName (Lola), Surname (Marshall), Centimeters (174), and Gender (female). The right form has fields for GivenName (Lola), Surname (Marshall), Centimeters (174), Gender (female), and a new field ShoeSize (UK) with value 7. A large black arrow points from the right form's Surname field towards the ShoeSize field, indicating the addition of a new attribute. Both forms have a 'Save changes' button at the bottom.

Creating and editing attributes on the Configure attributes page

To create or edit an attribute manually, go to **Config > Configure attributes** from the main menu.

From there you can create a new attribute:

[Save changes](#) [Delete tagged attributes](#) [Merge tagged attributes](#)

Add new Attribute:

Name:

Type: ▾

Default Value:

Order of listing:

Is this attribute required?:

[Save changes](#)

You can also edit existing attributes:

attribute: 9 Centimeters

attribute: 10 Gender

attribute: 11 ShoeSize (UK)

Tag

Name:
ShoeSize (UK)

Type: ▾

Default Value:

Order of listing:

Is this attribute required?

Save changes **Delete tagged attributes** **Merge tagged attributes** **i**

You can,

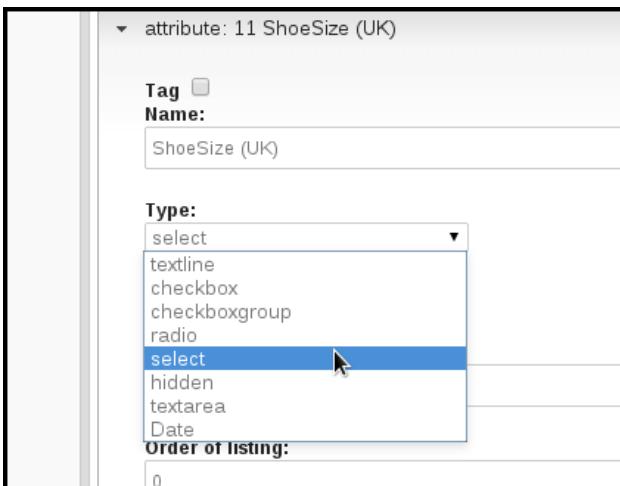

- Specify/change the name
- Choose/change the **Type**, which dictates the input method on your subscribe pages (see the example edit below)
- Choose/change the **Default Value**, which dictates the standard value on the subscribe page (you may need to change this on the Subscribe page editor too)
- Make the attribute required, so subscribers must give the information in order to sign up (warning: mandatory fields may deter subscribers)

Additionally you may,

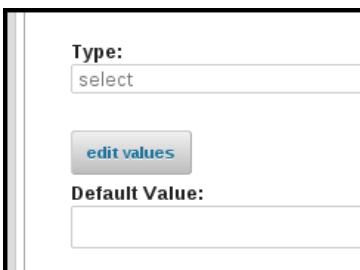

- tag them to delete one or more attributes
- tag to merge several attributes together

Example edit 1: changing the type from textline to select

In this example we will change the **Type** of the attribute for **ShoeSize**, which was automatically created during a csv file import, from **textline** to **select**. First we change the type to select using the dropdown menu, then we click the **Save changes** button at the bottom of the page.

Then we click the **edit values** button which appears below the **Type:** dropdown.

We can then add all the shoe sizes we want.

If you are editing an attribute that already has data in the system, some values may already be listed: if you try to add these again phpList will skip them rather than create a duplicate, so you can simply list all the values you want rather than search through.

CONFIGURE ATTRIBUTES

ShoeSize (UK)

[Back to attributes](#)

[Delete all](#)

Add new ShoeSize (UK), one per line

1
2
3
4
5
6
7
8
9
10

You can change the order of the values for the attribute. This will affect the order in which they are listed in the dropdown on the subscribe page. In this example the shoe sizes had become jumbled because some were already in the system and some were not, so we re-ordered them.

1	1
2	2
4	4
11	11
12	12
13	13
14	14

[Change order](#)

By changing the order, the choice given to subscribers when they sign up is clearer.

The screenshot shows a sign-up form for a newsletter. At the top, there are two radio button options: "Make this subscriber confirmed immediately" (unchecked) and "Send this subscriber a request for confirmation email" (checked). Below this, there is a field for "Email address" containing "anna@phplist.com", which is highlighted with a yellow background. A second "Email address" field below it contains "anna@phplist.com". There is also a checked checkbox for "I prefer to receive emails in HTML format". A dropdown menu for "ShoeSize (UK)" is open, showing options from 1 to 14. The number 7 is selected, highlighted with a blue background. A message below the dropdown says "Sorry there are currently no 14 letters available". A "Subscribe to the selected newsletter" button is visible. At the bottom left is an "Unsubscribe" link, and at the bottom right is a "POWERED BY phplist" logo.

Using Attributes

The primary use of attributes is as placeholders. Please see the placeholders chapter for information on how to use them. The segment plugin and the attribute select plugin allow you to send emails to subscribers with certain attribute values.

Using placeholders

A place holder is a word in square brackets, for example,

[FIRSTNAME]

or

[UNSUBSCRIBE]

which will be replaced with real data, such as the subscriber's name or a unique URL during sending.

Placeholders in phpList

There are three types of placeholder in phpList:

- System e.g. [UNSUBSCRIBE]
- Config e.g. [WEBSITE]
- Attribute e.g. [FIRSTNAME]

In this chapter we will deal with the Attribute placeholders only. We will deal with system and config placeholders in the templating and configuration chapters respectively.

Where to find a list of Attribute placeholders

When composing a campaign, you can find a list of placeholders by clicking on the information symbol, **i**, next to the text **Compose Message**.

Content

Send a Webpage Compose Message

Compose Message

10% of Sea Algae dog chews

Dear |

These Toothbrush treats are extra healthy, eco-fre
and completely vegan. They contain sea algae, w

Any **Attribute** placeholders will be listed here along with instructions on how to use them.

Dear [FIRSTNAME%%Friend],
and it will insert the FIRSTNAME for those subscribers that have this value, and "Friend" for all others.

Currently you have the following attributes defined:

Attribute	Placeholder
First name	[FIRST NAME]
Last name	[LAST NAME]

To send the contents of a webpage, add the following to the content of the message:
[URL:<http://www.example.org/path/to/file.html>]
You can include basic user information in this URL, not attribute information:

These are generated directly from your chosen Attributes so if you wish to edit them, please see the Attributes chapter.

How to use a placeholder in a mail

To use a placeholder, you need to type it exactly as suggested in the information, **i**, box. This will include:

- an open square bracket
- the placeholder name (in Capitals, with spaces)
- and a close square bracket

It is also wise to use some **fallback words**, that is words that will be inserted in place of the data when the data is missing. You can indicate the *fallback words* with the double percent sign **%%**. Anything before the %% is the attribute placeholder. Everything after the %% is the fallback text. The fallback text is optional.

In this example, the placeholder would either print the subscribers' **first name**, and where the name is not known, it will print the word **Friends**.

The screenshot shows a 'Compose Message' interface. At the top, there are two radio button options: 'Send a Webpage' (unchecked) and 'Compose Message' (checked). Below this is a toolbar with icons for Source, Word document, globe, file, bold (B), italic (I), underline (U), and other styling options. The main area contains the following text:

10% of Sea Algae dog chews

Dear [FIRST NAME%%Friends]

These Toothbrush treats are extra healthy, eco-freindly, entertaining and completely vegan. They contain sea algae, which has a high concentration of chlorophyll, proteins, iron, Omega 3 and Omega 6 fatty acids and a rich source of vitamins. These yummy treats:

It is important that you test your placeholder before you send your mail, as mistakes are ugly and disconcerting for your subscribers.

Set up two test accounts

To test your placeholder effectively you will need:

- one subscriber profile suitable for testing the attribute placeholder. You can use an alternative email to which you have access, where the attribute data is completed
- another subscriber using an email you have access to, where the attribute data is not completed.

You may need to add these emails or edit your existing data to achieve this. You can do all these things from the **Search > Search Subscribers** page.

In the example below I have subscribed myself to the system using my personal email (rather than my work email) and I have filled out my name.

Foreign Key	
First name	Anna
Last name	Morris
<u>Which ethical issues are you passionate about?</u>	

And I have another one using my old email address where the attribute data has not been provided.

Foreign Key	
First name	
Last name	
<u>Which ethical issues are you passionate about?</u>	

Send a test message

Next, enter the two test emails into the **Send Test** box at the bottom of your campaign **Content** page and press **Send Test**. You may need to confirm the emails if it is the first time you have used them.

Check the results

For the subscriber where the attribute related to the placeholder has data, you should see that data in the email. In this example you can see the name Anna is visible in the place of [FIRST NAME]

uk ★ Special Offer on Sea Algae dog chews • Ethica...

10% off Sea Algae dog chews

Dear Friends

These Toothbrush treats are extra healthy, eco-freindly, entertaining and completely vegan.

You can now send your campaign as usual.

Targeting your campaigns

In this example, Ethical Pets are sending out a campaign about a special offer on dog treats. They are targeting the campaign by only sending it to customers who have previously bought products for a dog.

There are several reasons for doing this:

- It enables more campaigns to be sent overall, which increases the impact of email marketing
- Most people will receive fewer campaigns, so they are not inundated
- Campaigns will be more relevant to readers
- Campaigns are quicker and easier to write, because they only need to be interesting to the target audience and not to everyone
- It is easier to measure the impact of the campaign

In this campaign only 35% of the total number of subscribers were emailed. Without segmentation either a large number of people would have received a campaign with little relevance to them or Ethical Pets would have needed to spend time trying to make the campaign have a broader appeal.

The overall consequences of segmentation should be:

- Happier customers
- Fewer unsubscribes
- More motivated marketeers
- Improved sales/responses to calls to action
- Improved customer loyalty/retention over time

Segmentation methods

The method of segmentation depends on,

- The quality of your data
- Where and how your data is stored
- What tools you have to segment it

In this example the segmentation was achieved using a Prestashop plugin, which allows the exporting of customer details based on the category of product bought.

The screenshot shows a category tree interface from a Prestashop-like application. At the top, there are buttons for 'Collapse All', 'Expand All', 'Check All', and 'Uncheck All'. Below this is a tree structure:

- Home
- Animal (1 Selected)
 - Dog
 - Dog Food
 - Dog Treats
 - Dog Accessories
 - Dog Collars
 - Health and Grooming
 - Puppy
 - Cat
 - Small Animal
 - Wholesale
- Ethical Issues
- Special Offers

At the bottom of the interface, there are two search bars labeled 'By supplier' and 'By'.

Unfortunately the Prestashop core does not provide very detailed data exports, and so a paid plugin was needed.

In other situations it may be possible to segment a list using:

- spreadsheet software
- database software
- the phpList segment plugin, to split the list using attributes

Adding a segmented list to phpList

A suggested methodology for adding a segmented list to phpList is:

- Synchronise your data - upload any new subscribers to phpList
- Create a new list
- Copy and paste the segmented emails into the new list
- phpList will pull in the rest of the data/attributes for you from the subscriber profiles

Having synchronised the data by uploading the latest data using a csv import, Ethical Pets went on to create a new list.

In this case a new list **Dog category purchasers** was created
(note: a private list, not public)

EDIT A LIST

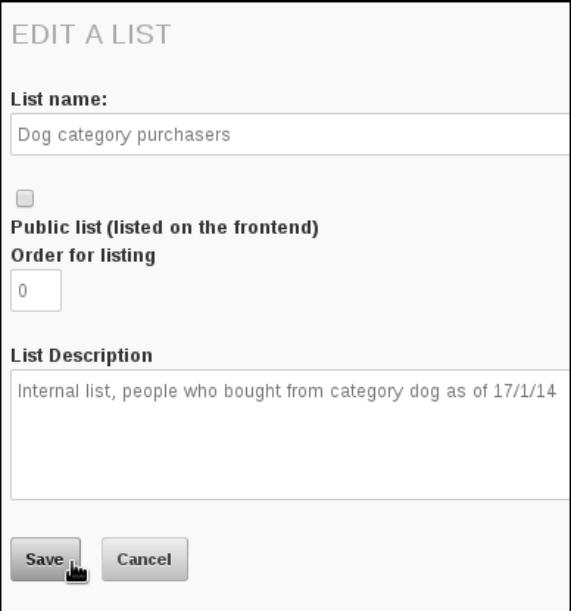

List name:
Dog category purchasers

Public list (listed on the frontend)

Order for listing
0

List Description
Internal list, people who bought from category dog as of 17/1/14

Save **Cancel**

Then the emails from the prestashop segmentation export were pasted in:

IMPORT SUBSCRIBERS BY CUT-AND-PAS

Adding subscribers **Dog category purchasers**

Please enter the emails to import, one per line, in the box below.
Emails"

Check to skip emails that are not valid

Import emails

The segmented list of subscribers are now all members of the list.

Tag all users in this page

Members

[REDACTED]	<input type="checkbox"/>  
[REDACTED]	<input type="checkbox"/>  
[REDACTED]	<input type="checkbox"/>  
[REDACTED]	<input type="checkbox"/>  

Sending to a segmented list

The process for sending to segmented lists is the same as sending to large, unsegmented lists. You simply select the list on the **Lists** tab of the campaign workflow. In this example we have put the segmented list in a category too.

lists

▼ Please select the lists you want to send your campaign to:

 Dog related segmentations

- Dog category purchasers (Private list)
Internal list, people who bought from category dog as of 17/1/14

Excluding a list

If you are sending a lot of mails and there is a chance that subscribers are in multiple segments and receiving lots of campaigns, you could consider using the exclude list functionality.

For example, if Ethical Pets wants to send a campaign to a list of cat product purchasers just a few days after they sent the email to dog product purchasers, they could exclude anyone on the dog list from receiving the cat related campaign.

While this involves prioritising which campaign is most important, the dog or the cat one, it means that the people who buy both dog and cat products are not receiving too many campaigns in total.

Activate the list exclude feature

You need to use

```
define("USE_LIST_EXCLUDE",1);
```

in your config.php

```
and mails are not sent "accidentally"
# on unmanaged systems

define ("TEST",0);

# list exclude will add the option to send a message to
users who are on a list
# except when they are on another list.
define('USE_LIST_EXCLUDE',1);

/*
=====
* Settings for handling bounces
*
```

The line of code and comments can be found in the extended config and copied over. If you do not know how to do this, you can find more information in the manual installation chapter.

Using the list exclude feature

In this example, Ethical Pets have sent an email to the cat product purchasers segment but excluded the dog purchasers segment. During sending phpList checks if the subscriber on the cat list is also on the dog list, and if they are, the email is not sent to them.

Additional ways to segment a list

Here are a few ideas for ways you could segment your lists:

- Subscriber location
- Subscriber interests
- Subscriber demographic (gender, age, shoe size etc)
- Subscriber actions (purchase, abandoned cart, signed petition, recent comment etc)

- Subscriber status (new to list, long-time member)
- Subscriber preference: ask your subscribers how often or when they would like to receive emails from you using an attribute on your subscribe page.

Additional benefits of segmentation

There are many benefits to list segmentation:

- You can a/b test aspects of your email, for example the tone/style/grammar of the subject line
- You can automate transactional messages, for example, messages offering help to customers who abandoned a cart. You can use a recurring campaign for this.
- You can tailor very specific emails, for example about events, to those who live in the location of those events.

DESIGNING AND ASSESSING YOUR CAMPAIGNS

Templates

The templating system in phpList is designed to create a workflow that keeps things simple for the campaign creator.

The Templating Workflow in phpList

There are two elements to the workflow:

1. Creating and uploading a template; this is done very rarely
2. Choosing and using the template; this is done for every campaign

Step one is the more complex and it is often done by a web designer or system administrator. We cover this in the creating a template chapter. There is also a really easy templates chapter to help you if you do not have a designer.

The second part of the workflow is very simple. The person creating the campaign simply selects the template by name from a drop down menu after the campaign message has been written.

The template is then applied during sending, like a wrapper around the text, and the person sending the campaign does not come into contact with the template code at all.

The template is *not* applied to emails sent to subscribers who request a plain text email.

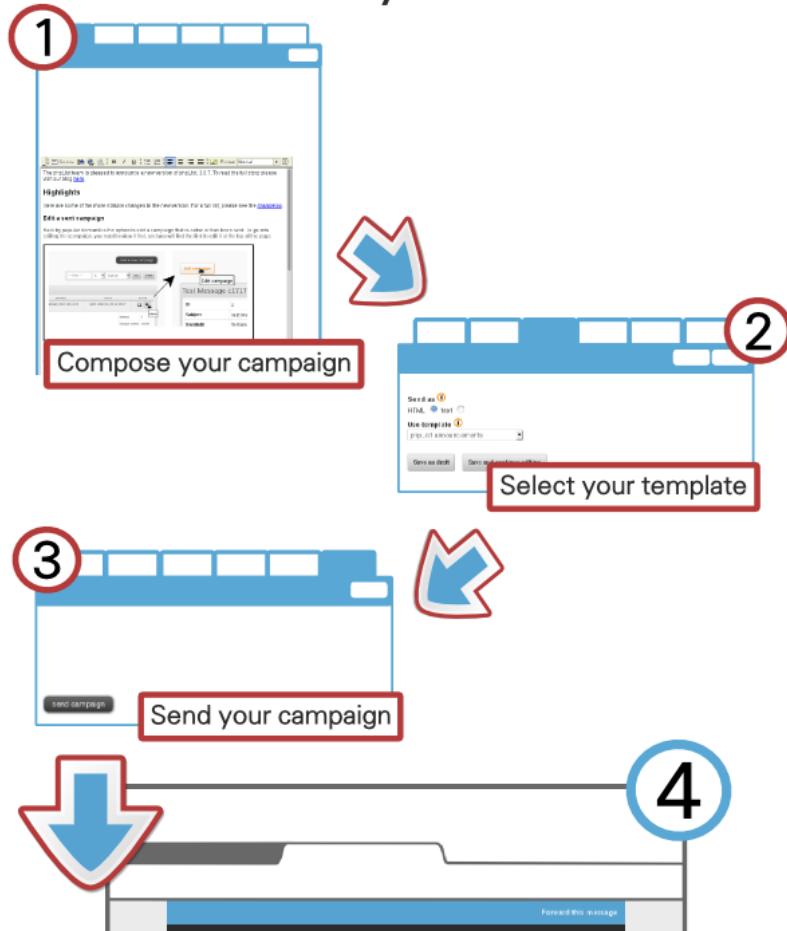

An infographic about templating in phpList

Templating in phpList

One time

Every time

The screenshot shows a news article from phpList.com. The header features the phpList logo and the text "phpList.com". Below the header, a blue banner reads "phpList 3.0.7 released - and a new manual is on the way!". A subtext below the banner says "The phpList team is pleased to announce a new version of phpList, 3.0.7. To read the full story, please visit our blog [here](#)". A section titled "Highlights" follows, with a note about notable changes and a link to the "changeslog". A sub-section titled "Edit a sent campaign" is shown with a screenshot of a campaign editor interface. The interface includes a toolbar with buttons like "CREATE A NEW CAMPAIGN", "New", "Edit", "Save", and "Cancel". An arrow points to the "Edit" button. A callout box with the text "Campaign text is wrapped in template" is overlaid on the screenshot.

Campaign text is wrapped in template

The Footer

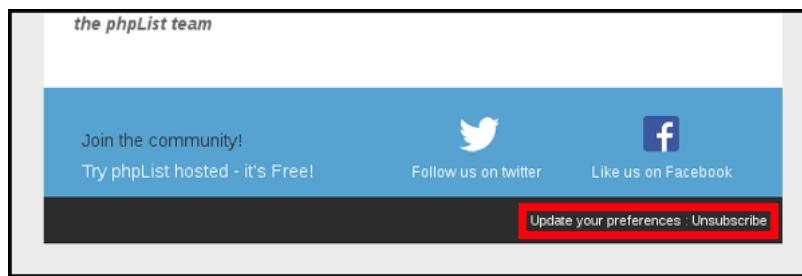

The phpList footer

- Is an active feature of the software, not simply a description of a design element
- Can be edited for each campaign from the content tab of the campaign workflow
- Is replaced by a secondary footer when the Forward to a Friend system is used
- Should contain the [UNSUBSCRIBE] placeholder
- Is placed in the template with the [FOOTER] placeholder

What is the footer?

In your template design you may have many elements which you think of as being "the footer." In the image below, for example, the blue and black coloured areas and all the content within them would commonly be described as the "footer."

However, you may not wish to add all of this into your phpList footer. For example, in the image below only the "update your preferences" and "unsubscribe" elements are within the phpList footer system. The rest is in the template itself.

You may wish to choose which items go into the phpList footer carefully because:

- The footer can be edited from the campaign composition tab: you may or may not want certain items to be edited on a campaign-by-campaign basis
- If the forward to friend placeholder is used, all content in the phpList footer will be replaced when the message is forwarded.

Adding your footer

Everything that goes in the phpList footer is added separately from the rest of the template.

To situate the a footer to your template use the [FOOTER] placeholder.

the [footer] placeholder

You should design your footer as a separate .html file

creating a footer for phpList

To add your footer to phpList go
to **Config > Settings** and **campaign settings**

adding a default footer to phpList

Find **Default footer for sending a campaign** then click the edit icon

edit default footer phpList

Paste in your footer code and click **Save changes**.

save changes to default footer

Your footer will now appear in the footer section of the content tab in your campaign workflow, where you can tweak it.

footer in compose window

As well as in your campaigns when you send them

footer in campaign

The Forward to Friend footer

On the **Config > Settings** page, there is a second footer called **Footer used when a message has been forwarded**.

If you use the **[FORWARD]** placeholder, and a subscriber forwards the email, this footer will replace the usual one. It contains the following text:

**This message has been forwarded to you by
[FORWARDED BY].**

You have not been automatically subscribed to this newsletter.

If you think this newsletter may interest you, you can [SUBSCRIBEURL] and you will receive our next newsletter directly to your inbox.

If you wish to use the forward to friend system you should edit this footer so that it has the correct appearance while maintaining the appropriate text.

Creating a template

Creating your template

There are lots of ways to create your template. You could

- Design and write your own
- Pay someone to do this for you
- Modify a generic/Open Source template that you have bought or "recycled"
- Use the super-simple DIY template in the next chapter.

Here are some tips to help you set up your template for use with phpList.

If you don't understand the information in this chapter and you don't have anyone to help you with your template, then skip to the next chapter for a super simple template.

The Basics

You should use inline styles, and unless you have configured phpList especially with a plugin, you must use a single column template.

If you choose a responsive template, your campaign editor should not use images with a width larger than a smartphone screen (max 320 by 480 pixels).

The *footer* in phpList is quite specialized and is described in a separate chapter. If you plan to have a footer in your design, please read the footer chapter before you start work.

Logo: upload or remote link?

When you are designing or modifying your template, you need to decide if you will include your logo in the campaigns as an attachment or use a remote image. If you include your logo as an attachment it will always display to the recipient.

an uploaded logo is included in your campaign

If you use a remote link, however, the image will only display when the subscriber gives permission (in most email and webmail clients).

If you decide you upload your image then leave the local link (or just a use a "broken link") and you will be prompted to upload the image when you are adding your template to phpList.

A mandatory placeholder in the body

You must include some strings that phpList will replace during the sending stage.

[CONTENT]

The obligatory string is [CONTENT]. This will be replaced with the content of your message when you send your campaign.

the content placeholder in phpList [content]

Adding your template to phpList

To add a template to phpList, go to **Campaigns > Manage campaign templates** from the main menu.

manage campaign templates phpList

You will then see a list of templates already in the system. By default there is one template, the system template (which styles things like the confirm subscription emails).

add a new template

Click **Add new template**.

Name your template

First, give your template a Title. This will display in the list of templates to choose from during the campaign composition stage, so it is important that the name makes sense to the person writing the campaigns.

In this case we called the template **phpList announcements**, because it is the template we use when we announce a new version of phpList. We have different templates for community news and phpList hosted special offers, for example.

name your template and upload it

Upload your file

To add your template you can paste the html into the editor, or upload it as a file. In this example we are uploading it.

Click the **Browse** button, locate the template file on your computer and click **Open**. The file name will then appear next to the **Browse** button (as shown in the image above).

Save your template

Scroll to the bottom of the page and click **Save changes**, using the checking tools if you wish.

save your new template

Upload your logo?

The next screen gives you an opportunity to upload your template images, if you have any. This will usually be a logo. In this case the logo is hosted remotely and so no image is listed to upload.

add images to your template, or not

Click **Save images**.

Your template will now be added to your list of **Existing templates**.

If you wish to set this template as the default for all campaigns, you can check the button under **CAMPAIGN DEFAULT**.

a new template

Defaults and settings

There are some default settings for templates and footers at **Config > Settings** under **campaign settings**.

For example you can choose which template will be used by default by referring to its ID.

specify default template phpList

The ID of the template can be found next to the template name when you go to **Campaigns > Manage campaign templates** from the main menu.

template ID phpList

Using your template

During campaign composition, use headings and other formatting as normal. You do not need to apply any additional styling such as text colour, if those elements are dealt with in your template.

compose ready for template

In the **Format** of the send campaign workflow, select your template from the **Use template** dropdown.

format tab of compose process choose template

The template and theme are then applied during sending.

template is applied

More template placeholders

This chapter contains additional details that may be useful for a designer who is creating a template for use in phpList.

[SUBJECT]

[SUBJECT] adds the subject of the email within the newsletter text.

[CONTENT] - a mandatory placeholder

This is where the message's content (body) will be inserted. Every template must have a [CONTENT] placeholder.

[FOOTER]

The message footer

[SIGNATURE]

[SIGNATURE] prints the phpList image signature.

[FORWARDURL]

[FORWARDURL] is replaced with the personalised URL only. To use this, you will need to wrap it in HTML, like this:

```
<a href="[FORWARDURL]">Forward to a Friend</a>
```

[PREFERENCESURL]

[PREFERENCESURL] allows the recipient to edit their subscribe preferences, for example update their email or the number of lists they belong to. This essentially allows them to maintain your list up to date for you and is an invaluable feature.

[UNSUBSCRIBEURL] - a mandatory placeholder

[UNSUBSCRIBEURL] allows the recipient to totally unsubscribe from all your lists. In phpList you must include this placeholder somewhere in your body or footer. It is best to use this along side [PREFERENCESURL] if you manage multiple lists, so subscribers can leave just one list rather than all lists if they want.

[DOMAIN]

Prints your domain, e.g. yourdomain.com as listed in your configuration settings.

[EMAIL]

Prints the subscribers email address;

Some older placeholders

These are some older placeholders which still work, but are not recommended for use:

[FORWARD]

[FORWARD] is a link where the recipient can go to "forward this message". The default text for this placeholder is **this link**.

For example, if you use "If you want to forward this message to a friend click [FORWARD]", it will come out as:

□

[UNSUBSCRIBE]

Like Forward the link that subscribers can use to unsubscribe. It will also be replaced with "This Link", which means you can use it like this:

To unsubscribe from our newsletter click [UNSUBSCRIBE]

[PREFERENCES]

Like Forward and Unsubscribe the link that subscribers can use to update their personal details and preferences. It will also be replaced with "This Link", which means you can use it like this:

To change your preferences click [PREFERENCES]

DIY: Super Simple Template

We have made a very basic template for you to use. You will also need

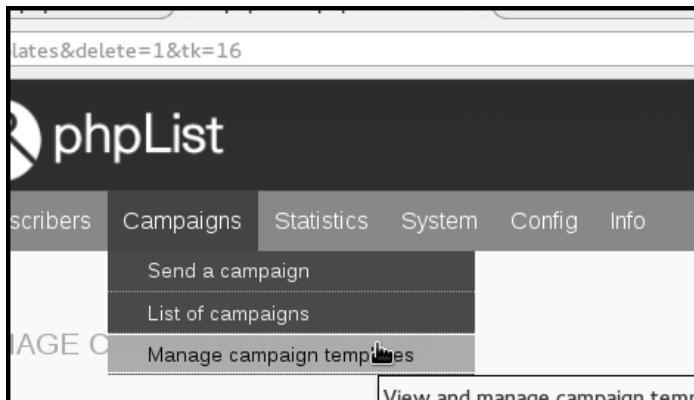

- A version of your logo or similar image measuring 300px wide.

Download and save the template

Download the template by clicking **here** and then saving the file to your PC.

Upload the template to phpList

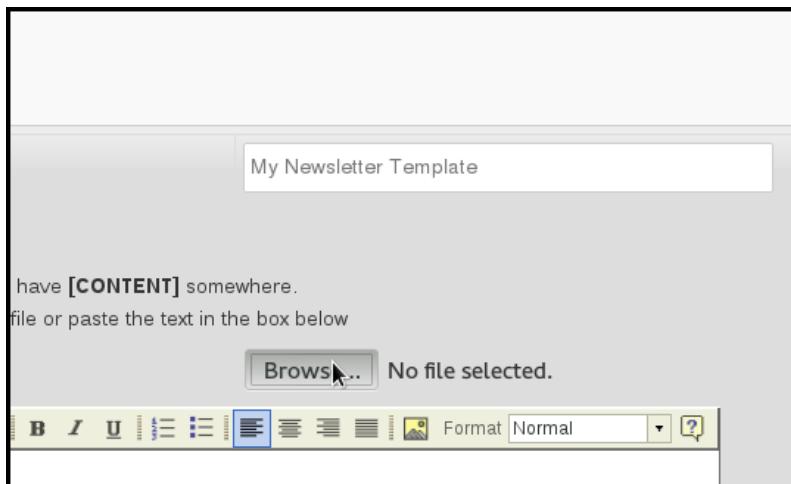

Go to **Campaigns > Manage campaign templates.**

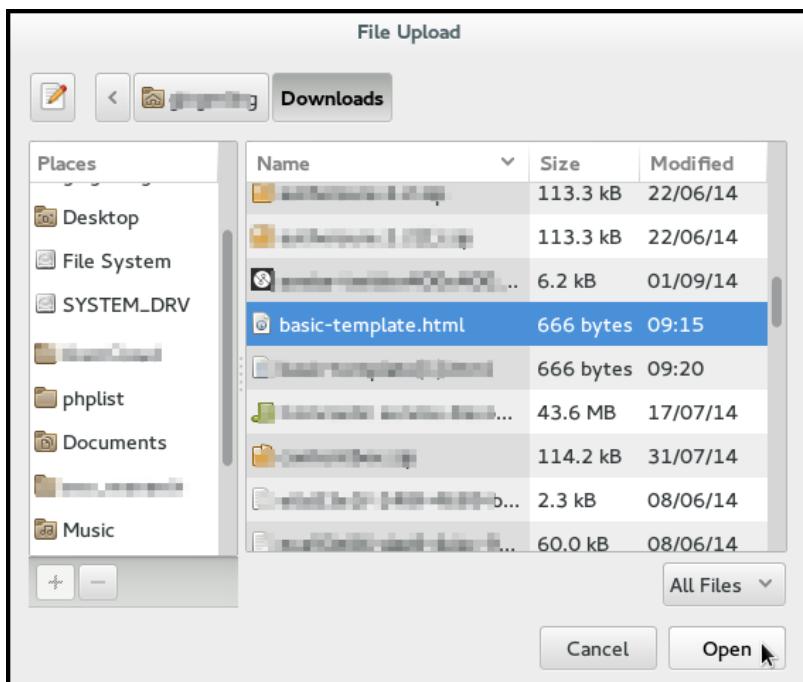

Click **add new template**.

A screenshot of the 'MANAGE CAMPAIGN TEMPLATES' page. The page header says 'MANAGE CAMPAIGN TEMPLATES'. Below it, a message states 'No template have been defined'. At the bottom, there are two buttons: 'Add new template' (which is highlighted) and 'Add default system template'.

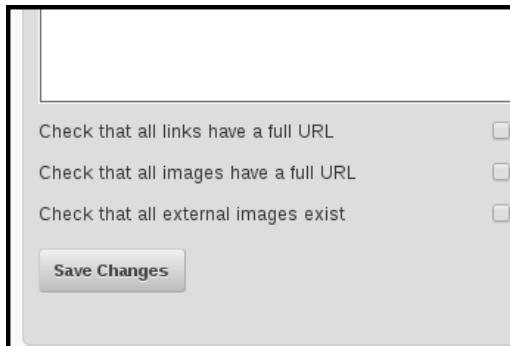

Give your template a name, for example **My Newsletter Template**. Then click **Browse**.

Select the file you downloaded earlier, called **basic-template.html**, from your computer and click **Open**.

Then click **Save Changes**.

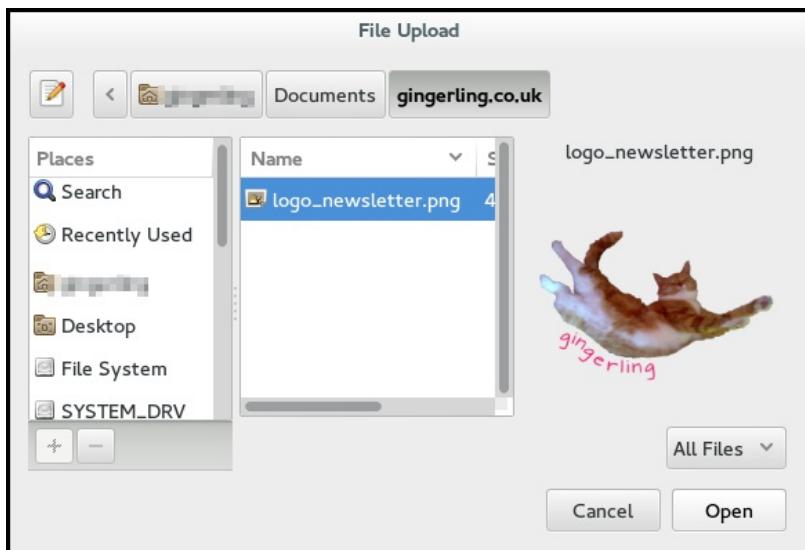

Upload your logo to phpList

You will then be directed to add your logo. Remember, it must be no more than 300 pixels wide. Click **Browse**.

The page title is 'ADD OR EDIT A TEMPLATE'. Under the 'Images' section, it says: 'Below is the list of images used in your template. If an image is deleted, it will be removed from the database.' It lists an image named 'logo.png' (1 times used) with the note 'No Image was found'. There is a 'Browse...' button with a tooltip 'No file selected' and a 'Save images' button.

Select your logo file from your computer and click **Open**.

Click **Save Images**.

Make the template your default?

You will see your new template added to your list of existing templates. If you will use this template for most of your campaigns, click the radio button under **Campaign Default**.

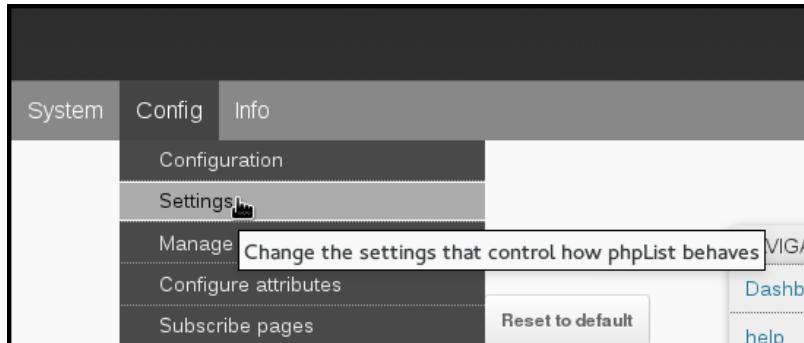

A screenshot of the 'MANAGE CAMPAIGN TEMPLATES' interface. It shows a table titled 'Existing templates' with one row: 'My Newsletter Template' (ID: 2). A red box highlights the 'CAMP. DEF.' column, which contains a radio button. Below the table are 'Delete' and 'Search' buttons. The top right corner has a 'HELP' button.

Copy this footer text

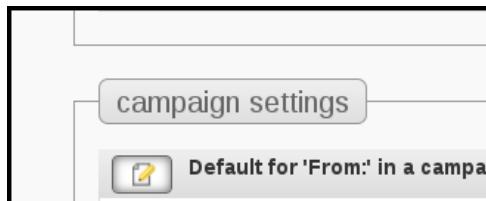

```
<a href="[PREFERENCESURL]" title="Update your preferences">Update your preferences</a> | <a href="[UNSUBSCRIBEURL]" title="Unsubscribe" >Unsubscribe</a>
```

Add the footer to phpList

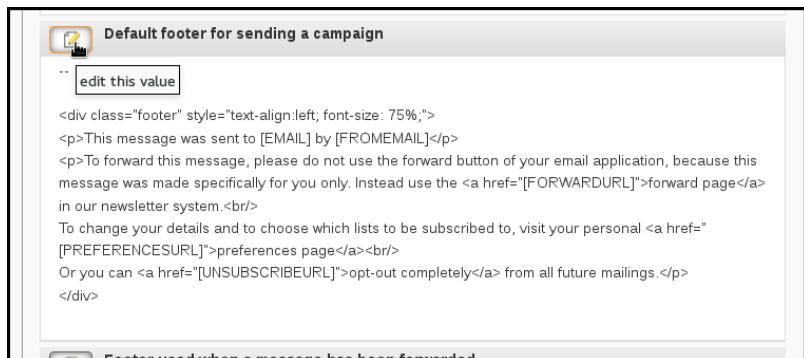

First go to **Config > Settings**.

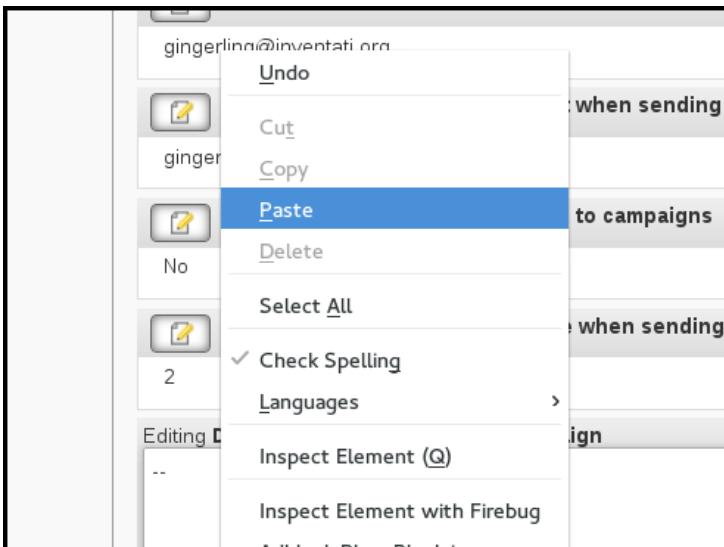

Then scroll down till you find the **Campaign Settings** area.

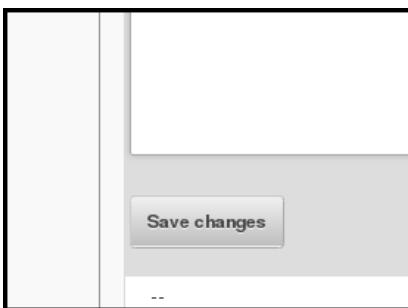

Click the edit icon

Delete the contents up to the -- and right-click to **Paste** in the html you copied from this chapter.

Click **Save Changes**.

Any new campaigns will now use this footer by default.

Using your new template

Compose a new campaign. In this example I have pasted the html from my latest blog.

Latest Blog: How to make a window-box from an old CD rack

From line ⓘ

gingerling@inventati.org

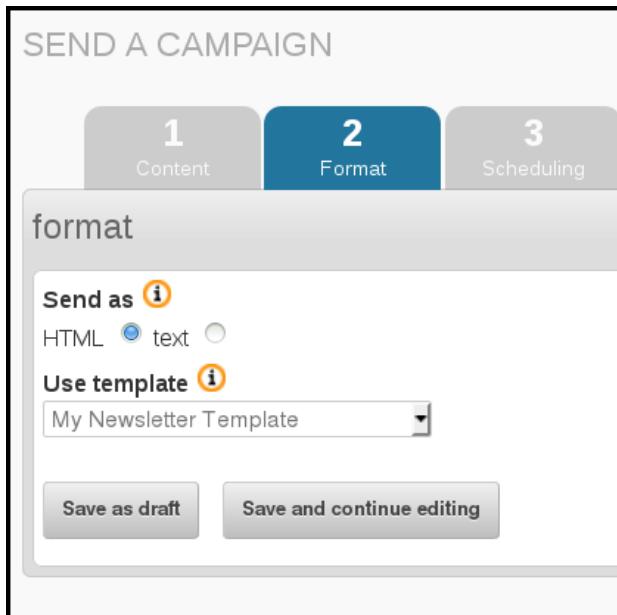

Content ⓘ

Send a webpage Compose message

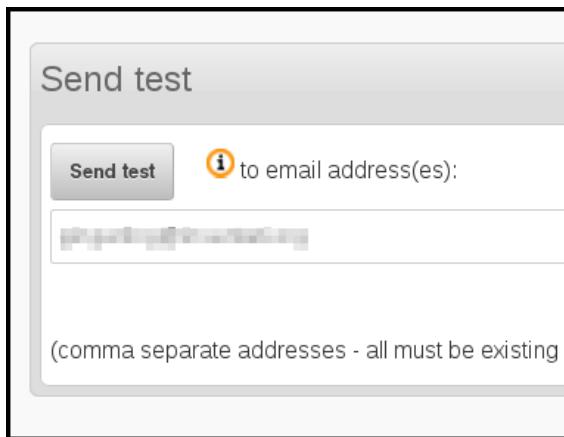

Compose message ⓘ

I am not a good gardener. I either don't do anything at all or I start over-large projects never leaving a wake of dead plants and weed filled containers behind me. But things have changed small damp north facing yard of my very own... so think it's time for me to have another go! The go-hero series of blogs will document my successes and failures.

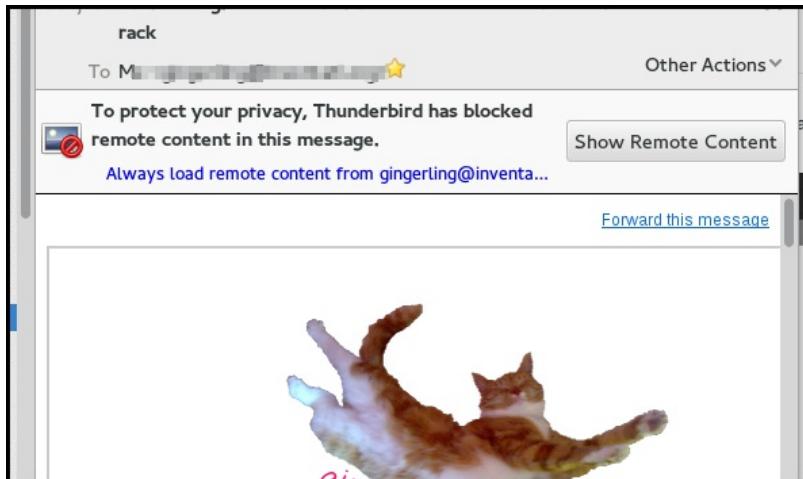

Check that you are using your template by clicking **Next** and examining the **Format** tab.

Send a test message using the **Send test** box at the bottom of the page.

Take a look at the email when it arrives. You will notice your logo displays even when other, remote images are blocked, because phpList has sent it as an attachment.

And you can see your template has been applied,

A window box

I have been reading [The Thrifty Gardner](#) by [Alys Fowler](#), a long-unread but 10/10 Christmas present from my parents. Having just bought a house I am pretty much broke and her fun, practical and cheap/free gardening ideas are just the ticket. She mentioned using an old CD rack for a window box, and I happened to see one for a few pounds in my local charity shop - CD's are going out of style so keep your eyes open for these in skips, tips and charity shops.

Strengthen the corners

Having ripped out all the plastic bits where the CD's ship into, I strengthened the corners so the box will cope better with the wet outside. I tried using little L-shaped brackets but that didn't work because there wasn't enough space to drill/screw at a sensible angle, so I (well, my other half Joey) just nailed it together a bit more. In retrospect, I should probably have used screws instead - next time I will do this better.

Subscribe page design and configuration

Subscribe page is the name of the page where your subscribers can join your lists. You can have as many subscribe pages as you want, and you can make them look like your website.

You can customize your subscribe pages in various ways. You can edit the default design, which will affect all the pages, on your **Config > Settings** page, and/or you can tweak the design of individual pages using the **Header** and **Footer** boxes on the subscribe page editor.

Modifications from within the Config > Settings page

Go to **Config > Settings** from the main menu, and scroll down to the **subscription-ui settings** area. Here you can edit the html of the pages, and also a few basic settings.

Modifications from within the subscribe page editor

The **Header** and **Footer** boxes in the **General Information** section of **Config > Subscribe Pages** > add/edit a page can be used to edit the HTML of an individual subscribe page.

The html in these boxes is generated from the defaults in **Config > Settings > subscription-ui settings**, which can also be edited (see above).

You don't need to use <HTML> <head> etc, as phpList already includes this for you. However, you can add your own Meta Tags and CSS file links or your own <scripts> just so long as all these extras are above the </head>.

If you create your own CSS styles for your page, save the file outside of the phpList folder structure, for example in the stylesheets directory. Then add a rel link to the new file above the </head> tag. Keeping it outside of the phpList folder structure will make it easier to upgrade later on.

```
<link rel="stylesheet" href="/styles/customized.css" type="text/css">
```

Advanced Customisation

You may wish to heavily customise of your Subscribe page, to make it look like it is part of your website (rather than third party software).

You should use a HTML editor for this task. You create a blank page in your HTML editor, then copy and paste the contents of the Header box and replace the code </head> <body> in the HTML editor with the copied code.

You will need to be careful with exactly how much you paste into the **Header** box and whatever you do paste must fit within the <TABLE> below the <!-- Top table starts -->

Advanced Campaign Statistics

This chapter covers

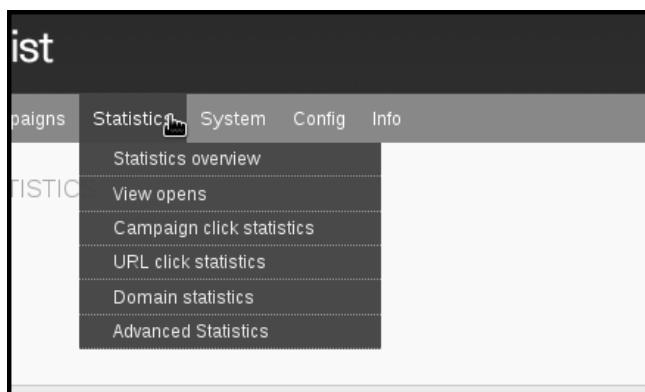

- The statistics menu
- Drilldown by campaign into clicks and/or opens
- Domain statistics
- Using a Google tracking code
- Forward to a friend.

Basic statistics, as found in the Statistics Overview, are covered in the chapter called Basic Campaign Statistics.

The Statistics Menu

The statistics menu pulls together a lot of features. It is worth exploring what can be found through this menu. The main items on the menu are Overview, Opens, Campaign clicks, URL clicks and Domain statistics. You may also see other options, for example Advanced statistics, if you statistics plugins is activated.

To get a basic understanding of what data is available you can work methodically from the top down, first viewing each page, then seeing what links are provided in each page, and onwards. You will often come full circle.

In this chapter we will approach our drilldown from analysing one campaign, covering both opens and clicks. You can also compare multiple campaigns, or focus on a specific URL you are trying to drive traffic to. The approach you take depends on the questions you are trying to answer.

Drilling down into an individual campaign

The starting point for an analysis of a single campaign is the campaign statistics overview. This can be found in **Campaigns > List of campaigns > Sent Campaigns** by clicking on the graph button

The screenshot shows a table row for a campaign. The first column contains the campaign name: "The phpList Autumn 2014 survey". The second column shows the send date and time: "24 October 2014 14:01:58". The third column shows the send date and time: "Sent 2014-10-24 17:15:23". To the right of the third column is a small box containing a bar chart icon, which is highlighted with a red box.

and also by visiting **Statistics > Statistics overview** and clicking on the name of the campaign.

The screenshot shows the "STATISTICS OVERVIEW" page. At the top left is a "Download as CSV file" button. Below it is a summary section with the campaign name "The phpList Autumn 2014 survey" and a progress bar indicating 300%. The main content area has a large title "The phpList Autumn 2014 survey" and a progress bar below it.

Either of these routes will bring you to the Statistics Overview for a campaign. The page gives you an overview of information and two ways to drilldown are available.

Opened Drilldown

By clicking the number of opens, you can get a page called Open Statistics.

Bounced	1533
Opened	2075
% Opened	24.03
Clicked	121
% Clicked	1.40

This page allows you to **Download as a CSV file** a list of those subscribers who were registered as having opened the campaign (remember this is by no means everyone, only those *recorded*).

The csv file can in turn be used to create lists of active subscribers, or by using the list-exclude feature you can isolate *inactive* subscribers too.

Domain Statistics

The **Domain statistics** page is accessible from the main statistics menu and it is a fascinating page which can give you real insight into the nature of your subscribers.

Using a google tracking code

Using a Google tracking code ensures that any visits to your website from the campaign are recorded in Google Analytics, *if* you have Google Analytics tracking installed on your site.

Google tracking is quite different to the in-built phpList opens/views tracking. Firstly the data is not collected, stored or viewed in phpList. Also, if you link to another website in your campaign and if that website *also* has Google Analytics tracking on their site (which is likely) then they also receive data. In that sense the tracking code is not exclusive to you.

To turn on Google tracking for an individual campaign, click the **add Google Analytics tracking code** in the Finish tab of the campaign workflow.

Forward to friend

On your **Statistics > Statistics overview** page, the third column, **FWDS**, shows the number of people who have forwarded the mail through the phpList **ForwardToFriend** system.

This system uses a placeholder to create a link or form in the email body or footer of your campaign for your subscribers to use to forward the mail to someone else.

If your subscribers use this method to forward your campaign, any actions (clicks, forwards etc) taken by the new recipient will be included in your campaign statistics separately.

It is possible for you subscribers to forward the message by other means, but you cannot reliably tell: any clicks or opens in an email which has been forwarded without the Forward to a Friend system will be recorded as actions of the original subscriber.

It is therefore worth including an option to forward the campaign, using the **[FORWARDURL]** placeholder, in the header or footer. For example,

using forward to freind feature in footer of phpList

The subscriber will then see a forwarding link in the email footer:

forward link in footer, phpList

When a subscriber clicks this link they are prompted to enter an email:

forward to freind system, phplist. enter an email

INSTALLING AND UPGRADING

Installing phpList manually

This chapter explains how to manually install phpList. You may wish to install it using an automated tool if one is available to you. See the auto-installation chapter for more information on this.

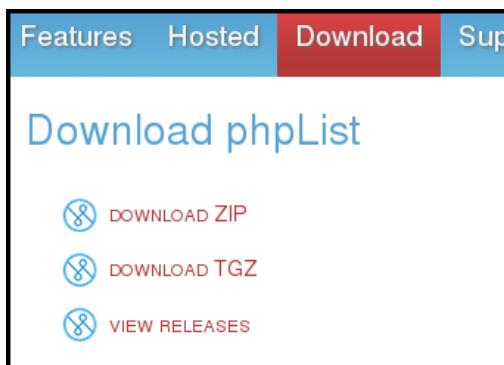

Overview of phpList installation

phpList lives in its own folder called "lists." Manual installation follows these steps:

- Download phpList
- Unzip phpList
- Upload to your server using FTP
- Create a database
- Add the database details to the config.php file
- Configure using web interface.

Download phpList

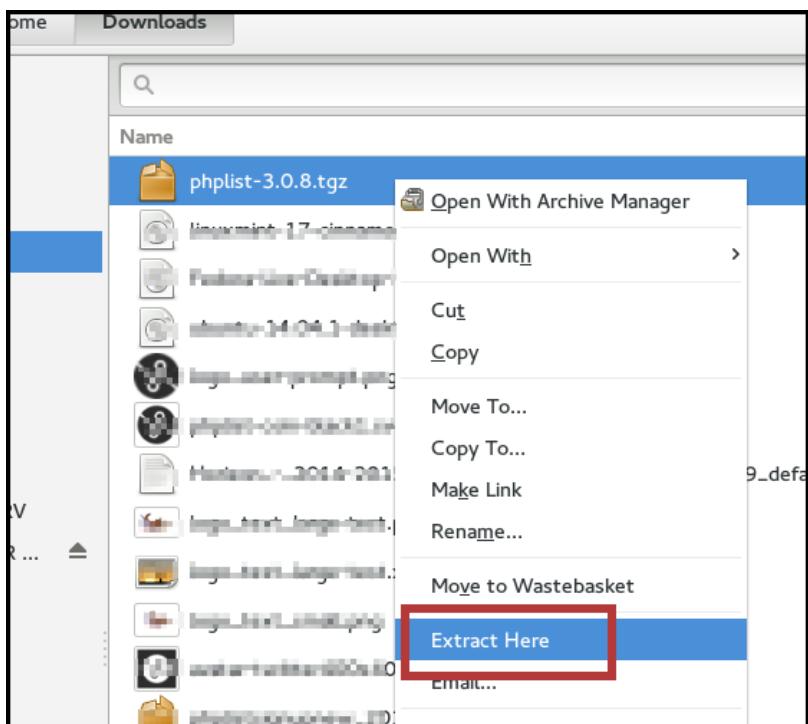

First download the latest version of phpList from <http://www.phplist.com/download> by clicking either **Download ZIP** or **Download TGZ**.

The link will take you to SourceForge, where your download will begin after a few seconds. Depending on which browser you use, you may be asked to click **Save** before the download starts.

Unzip phpList

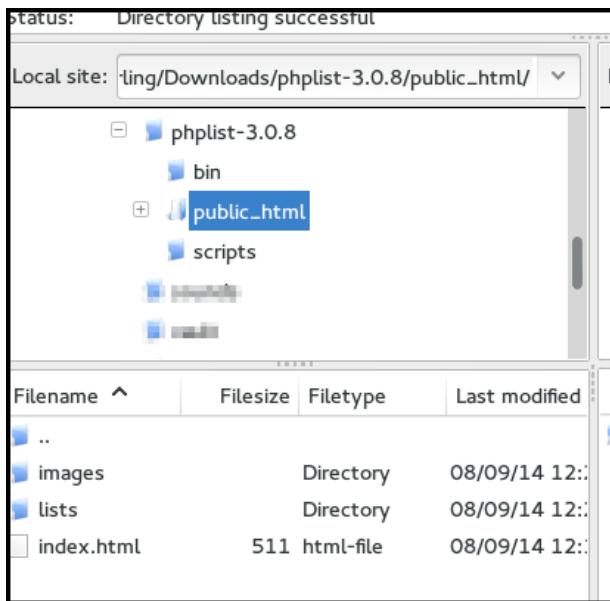

Once you have downloaded phpList to your computer, unpack it to a temporary folder. You can usually do this by right clicking and choosing **Extract Here** (Linux, as in screenshot), double clicking the folder (mac) or right click "extract all" (Windows).

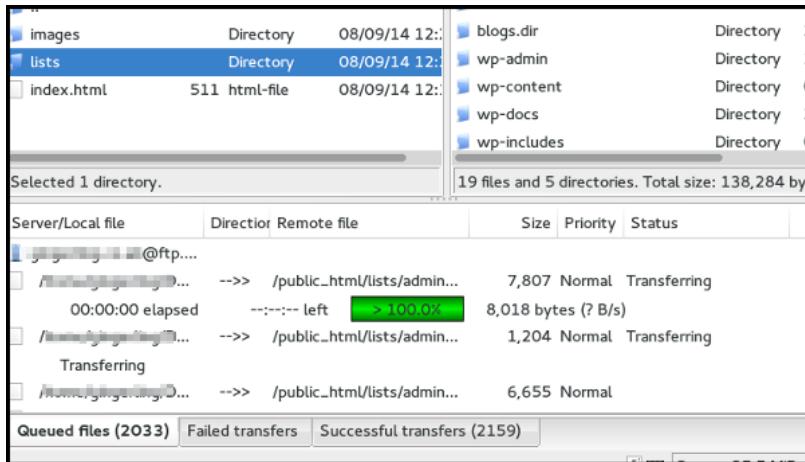

Upload to your server using ftp

Start your favourite FTP program, in this case we are using FileZilla.

Browse though to your temporary folder in the FTP program, then open the public_html folder to find the lists folder.

Upload this **/lists** folder into your public_html file on your server. This folder may have lots of files in it already. In the image below you can see the public_html folder on the server contains folders for a WordPress site.

Grab a Coffee!

This upload may take some time, you may even have to split it over a number of partial uploads depending on your connection speed, time outs and upload limits.

Filename ^	Filesize	Filetype	Last modified
..			
blogs.dir		Directory	28/06/14
lists		Directory	07/10/14
wp-admin		Directory	13/05/14
wp-content		Directory	08/09/14
wp-docs		Directory	28/06/14
wp-includes		Directory	08/09/14
.htaccess	391	File	12/08/14
index.php	418	php-file	06/11/13

Create a database using your control panel

Once you have uploaded the **/lists** directory, go to your hosting control panel and create a database. If you need help, your web hosting company can help you with this.

Whatever the process, you will always end up with three things:

- A database name, for example cl52-phplist
- A database username, for example phplist
- A password for your database, for example T!LcDaM/4

An example of creating a database

These screenshots provide an example. This may or may not be similar to the way you can create a new database on your server. That depends entirely on which software your hosting company uses.

First click **MySQL Databases**.

Then type in the new database name (we used the name phpList) and enter or generate a strong password. *Make sure you keep a copy of these details!*

You have 2 databases left.		
Username	Password	
phplist	[REDACTED]	<input type="button" value="Generate Password"/>
<input type="button" value="Create"/>		
Create a Stand alone MySQL User (advanced only)		

This system creates a user automatically, where the username is the same as the database name (a common preference). In other software you may need to add a new user separately and you may also need to allocate this user to your database.

Your database is now ready. Copy down the details because you will need them in a moment.

Manage MySQL Databases

To restore a database which you've previously backed up, click

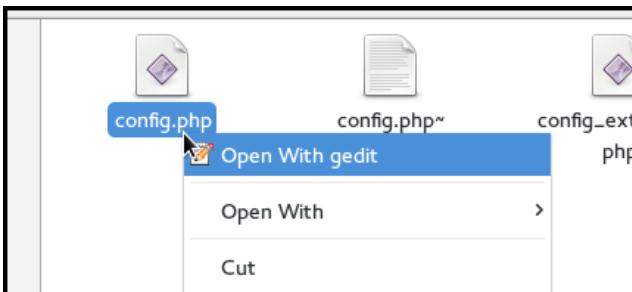

Restore Backup

Server	Username	Password	Utilities
217.199.187.69 *	cl52-a-wordp-4b3	[REDACTED]	Manage Backup
217.199.187.69 *	cl52-phplist	[REDACTED]	Manage Backup

Edit the phpList config.php file

Next, you need to put the details of your new database into your configuration file.

Browse your temp folder on your computer and go to **lists > config > config.php**. Load and edit this file in a *text editor*, such as Notepad (windows)TextEdit (mac) or Geany/Kate/Gedit/etc (linux).

Never use a word processor program (like Microsoft Word), it will only generate formatting and disruption.

Your freshly downloaded config.php should look something like this:

The screenshot shows a code editor window titled "config.php". The menu bar includes File, Edit, View, Search, Tools, and Documents. The toolbar contains icons for Open, Save, Undo, Redo, Cut, Copy, Paste, Find, and Replace. The code editor pane displays the following PHP configuration file:

```
<?php

/*
=====
* The minimum requirements to get phpList working are in this
file.
* If you are interested in tweaking more options, check out the
config_extended.php file
* or visit http://resources.phplist.com/system/config
*
* ** NOTE: To use options from config_extended.php, you need to
copy them to this file **
=====

*/
# what is your Mysql database server hostname
$database_host = "localhost";

# what is the name of the database we are using
$database_name = "phplistdb";

# what user has access to this database
$database_user = "phplist";

# and what is the password to login to control the database
$database_password = 'phplist';

# if you have an SMTP server, set it here. Otherwise it will use
the normal php mail() function
```

At the bottom of the editor, there are status indicators: PHP, Tab Width: 8, Ln 21, Col 48, and INS.

There are four places where you need to replace the word in "quotes" at the end of a line of code with something specific to your server:

```
# what is your MySql database server hostname
$database_host = "localhost";
```

If you do not know what to enter here, you will either need to use trial and error, or ask your hosting provider what to put here. *If you want to keep things simple, ask your hosting provider.*

Trial and error:

You may be lucky in that your server allows "**localhost**" for your \$database_host entry, in which case you don't need to make a change (this was true in our example below). The second option to try is "127.0.0.1".

If these fail you will receive an error towards the end of installation. If both of these fail then this entry must be something specific to your server. GoDaddy and 1&1 servers are pretty specific, for example.

```
# what is the name of the database we are using
$database_name = "phplistdb";
```

Replace the **phplistdb** with the name of your database that you set up earlier. In our example below this is **cl52-phplist**.

```
# what user has access to this database
$database_user = "phplist";
```

Replace the **phplist** with the name of your database user you set up earlier (this may be the same name as your database). In our example below this is also **cl52-phplist**.

**# and what is the password to login to control
the database**
\$database_password = 'phplist';

Replace the **phplist** with the password you created. The password in the example below is obscured.

```
/*
 * what is your MySql database server # what is your MySql database server
 $database_host = "localhost";           $database_host = "localhost";

 * what is the name of the database w# what is the name of the database we
 $database_name = "phplistdb",           $database_name = "cl52-phplist";

 * what user has access to this database# what user has access to this database
 $database_user = "phplist";           $database_user = " cl52-phplist ";

 * and what is the password to login ·# and what is the password to login t
 $database_password = 'phplist';       $database_password = 'UpadL1P7V' ;
```

Test mode in phpList: ("TEST",0)

One other thing you will need to do, either now or at some point in the future, is to change the value of **TEST** in this file. Until you do this, your install is essentially in "sandbox" mode, and will not fully function.

By default test is defined ("TEST",1). Change this to define ("TEST",0) to be able to send messages out.

This is done automatically in the auto installers.

Config_extended.php

You may need to add some extra lines to your config.php. These extra lines are ready made for you in config_extended.php, which is in the same directory as config.php. Simply copy the lines you need and paste them below the others in config.php

Save and upload

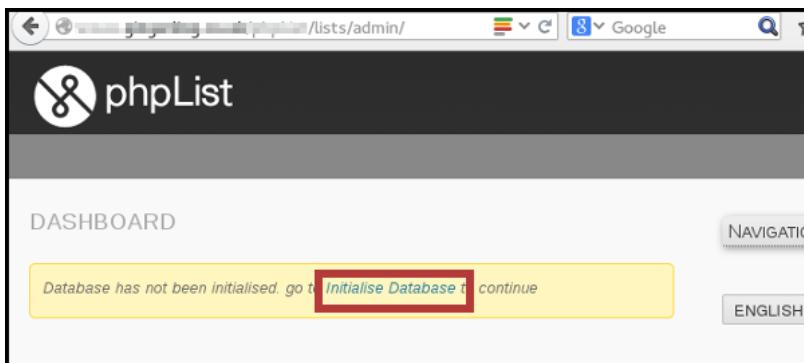

Once you have edited the config.php file you need to save it and upload this new version to your server. This can be done in the same way as your initial upload: open your ftp client, find the **lists/config/config.php** file on your pc and then upload it to **lists/config/config.php** on your server.

Go to your installation

Open your web browser and go to your installation. This is located at **http://mywebsite.co.uk/lists/admin**.

If you get an error saying that the database has not connected, then check your config.php file again: a tiny error such as a space before/after your database name/password will stop this from working.

When you see the grey and black interface with the phpList logo at the top, you are in the right place.

The final steps-

Click **Initialise Database** and fill out the form.

INITIALISE THE DATABASE

phpList initialisation

Please enter your name.

The name of your organisation

Please enter your email address.

The initial *login name* will be "admin"

Please enter the password you want to use for this account. (minimum of 8 characters.)

Continue

Click **Continue**

```
Initialising table adminlogon... ok
Initialising table admintoken... ok
Initialising table l18n... ok
Initialise plugin fckphplist
```

Success: [Tell us about it](#)

Sign up to receive news and updates about phpList

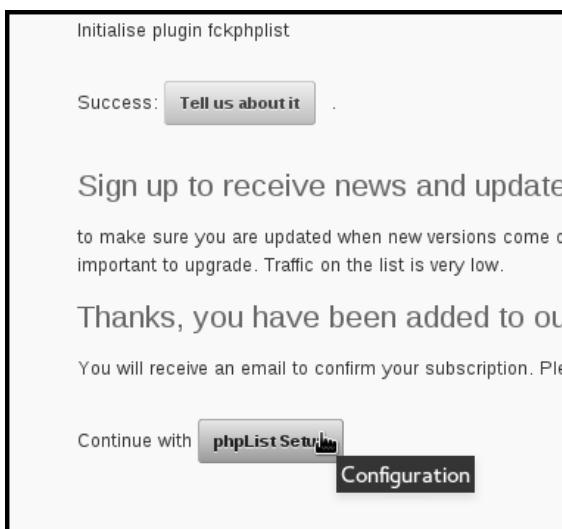

to make sure you are updated when new versions come out. Sometimes security bugs are found which make it important to upgrade. Traffic on the list is very low.

[Subscribe](#) [Do not subscribe](#)

- If you would like to email phpList to let us know you are using the software, click **Tell us about it**.

- We recommend that you sign up to receive email announcements about new versions of phpList. You can enter your email and click **Subscribe**. If you do not want to sign up, for example because you are already on the list, then click **Do not subscribe**.

Finally click to continue with **phpList seutp**.

You're done!

You have now finished installation, and the next step is configuration.

CONFIGURATION

configuration steps

- | | | |
|-------------------------|--------------------------|--|
| Initialise Database | Go there | |
| Verify Settings | Go there | |
| Configure attributes | Go there | |
| Create public lists | Go there | |
| Create a subscribe page | Go there | |
| Add some subscribers | Go there | |

Installing using an auto-installer

Softaculous, Fantastico, etc

If your web provider offers Softaculous, Fantastico or other similar software installers, then you may choose to use the. These installers do the bulk of the work for you and can be faster than installing phpList manually.

Log on to your web space, (cPanel/Plesk etc) and click on Softaculous/Fantastico then find the **phpList** installation and choose the **Install** option. *Please note, for this example I have used Softaculous installer.*

The screenshot shows a software installation interface. At the top, there's a navigation bar with tabs: Install (which is highlighted in blue), Overview, Features, Screenshots, Demo, Ratings, Reviews, and Import. Below the navigation bar, there's a brief description of what phpList is: "phpList is an open-source newsletter manager. phplist is free to download, install and use, and is easy to integrate with any website. phplist is downloaded more than 10 000 times per month." It also mentions that phpList is released under the [GNU/GPL license](#). To the right, there's a logo for "phpList" with a stylized 'p' icon. In the center, it displays "Version : 3.0.6" with a small icon, and "Release Date : 15-04-2014". On the left, there's a yellow star icon with the rating "4.27" and a link to "Rate this Script". On the right, there are two sections: "Read Reviews" (with a pencil icon) and "Software Support" (with a question mark icon). The support section includes a note: "Note: Softaculous does not provide support for any software."

On the Install page you can choose your settings. In the order shown in the image:

- **Protocol** http:// is the norm
- **Domain** if you have more than one domain on your hosting/web space, choose that here
- **Directory** you should set the directory that you wish your phpList installation to be placed in. ***This should usually be left blank*** however in this example we are using test/phplist1. Any variations will become part of the URL to your phpList install, so it is best to keep it simple
- A database name is suggested next. You may change it within limits to a name that makes more sense to you if you wish. 8 characters are usually the maximum here as it will be prefixed to your hosting username (eg:user234_phplst1 in my example).

Important! If you have only one database available to all your websites, then it is very important to use a unique identifier here, one that makes sense to you as belonging to this phpList installation. If you have access to a number of databases, then it's an advantage to use one per installation.

- Ignore the settings for the Cron job for the time being, there is some information on this in a later chapter
- Site Settings: chose the name for your site, and change the default Table Prefix if you wish
- Finally, enter your username (admin by default), user password, make it a good strong one. Real name and email and then click on the Install button.

The screenshot shows the configuration interface for installing phpList. It consists of several sections:

- Software Setup**:
 - Choose Protocol**: A dropdown menu showing "http://".
 - Choose Domain**: A dropdown menu showing "webspace.com".
 - In Directory**: An input field containing "test/phplist1".
 - Database Name**: An input field containing "phplist1".
 - CRON Job**: A section with a note about CRON requirements and a dropdown menu set to "14" for minutes, "17" for hours, and "*" for days.
- Site Settings**:
 - Site Name**: An input field containing "phpList Demonstration Site".
- Database Settings**:
 - Table Prefix**: An input field containing "pl_".
- Admin Account**:
 - Admin Username**: An input field containing "admin".
 - Admin Password**: An input field containing "ASH3425N947R". A green progress bar indicates the password is "Strong (71/100)".
 - Real Name**: An input field containing "Administrator".
 - Admin Email**: An input field containing "admin@ webspace.com".

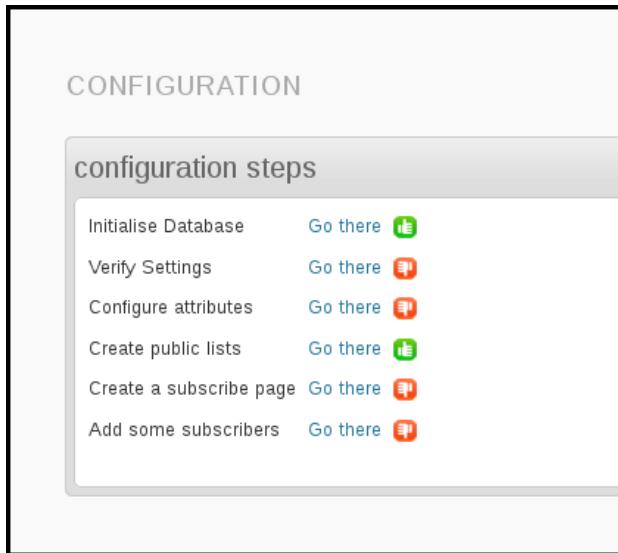

Wait for it to complete installing your phpList and you will get a final page offering the links to the public "front end" and the Admin "back end"

That's it, you've installed phpList with Softaculous or Fantastico.

One final thing to remember is that if you install phpList using this method, you can update phpList to a later version in a matter of minutes via the Update option offered in Softaculous/Fantastic. Do however make a backup of your config/config.php file before starting the update especially if you have customised your settings.

Configuration: verify settings

The configuration process starts after installation when you see this screen:

This chapter deals only with the **Verify Settings** instruction, because attributes, lists, subscribe pages and subscribers are dealt with in other chapters.

The **Settings** page discussed in this chapter is normally accessed through **Config > Settings**. There are lots of settings you can change at any time, however, it's good to have an overview after install.

To start your settings verification click **Go there** next to **Verify settings** in your configuration overview, or navigate to **Config > Settings** from the main menu.

Please note you do not need to click save for every item, keep editing and click save just once at the end.

General Settings

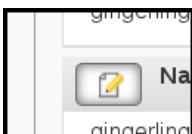

These settings will have been completed for you during installation. This example is taken from a personal website/blog.

general settings

	Website address (without http://)
www.gingerling.co.uk	
	Domain Name of your server (for email)
gingerling.co.uk	
	Person in charge of this system (one email address)
gingerling@gingerling.co.uk	
	Name of the organisation
gingerling.co.uk	

security settings

If any of these is incorrect, change it by clicking on the edit icon:

[WEBSITE] placeholder

Once you have set your website address, it will be used to complete the [website] placeholder if you use this in your template or content.

Security settings

Checking for new versions:

It is important that you keep your installation secure: this means keeping it up to date. This setting, defaulting to 7 days, is how often your phpList will check for updates. When you are notified of a new version, you should update as soon as you can.

The screenshot shows a configuration interface with a black border. Inside, there are two sections: 'security settings' at the top and 'reporting settings' at the bottom. The 'security settings' section contains a label 'How often do you want to check for a new version of phplist (days)' next to a file icon, and a text input field containing the value '7'. The 'reporting settings' section is partially visible below it.

Reporting settings

These settings establish who will be notified, by email, of events in your phpList install. These include **system messages**, such as notices of new subscribers, or **reports** such as when your campaign sending starts and finishes.

reporting settings

 List of email addresses to CC in system messages
(separate by commas)

Editing Who gets the reports (email address, separate multiple emails with a comma)

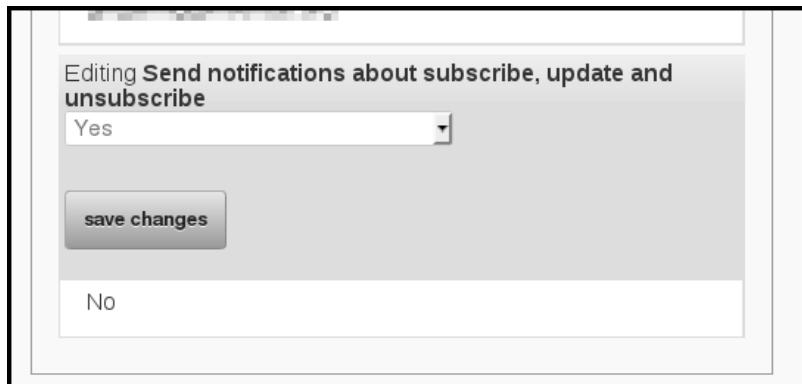

save changes

 Send notifications about subscribe, update and unsubscribe

It may be that you have a team of people or just an individual, some standard emails, like name@mydomain.com, or specific secondary accounts, like phpList_admin@mydoimain.com.

You can change these settings any time, but it's good take some time to decide how you want to manage your system now.

You can also choose to send yourself notifications about subscriptions among other things. To edit this setting click the edit icon, choose **Yes** from the dropdown and click **save changes**.

Campaign settings

This section specifies many of the defaults for your campaigns, for example, which email to display in the **From: line** of your campaigns (the sender).

campaign settings

 **Default for 'From:' in a campaign**
[REDACTED]

 **Default for 'address to alert when sending starts'**
[REDACTED]

 **Default for 'address to alert when sending finishes'**
[REDACTED]

 **Always add Google tracking code to campaigns**
No

 **The default HTML template to use when sending a message**
0

 **Default footer for sending a campaign**
--

```
<div class="footer" style="text-align:left; font-size: 75%;>
<br>This message was sent to [REDACTED] by [REDACTED]</div>
```

While you can change some of these options during the composition of each individual campaign, they will always display as stated here during the next new campaign.

If you will often use the same details, it is simpler and safer to specify them correctly here so you don't need to remember to add/edit these details every time you send a new campaign.

The settings regarding html template and the default footer are dealt with in the chapters about templates.

Transactional settings

These are the settings for the automatic emails that get sent by phpList to your subscribers when they perform an action. For example, when they subscribe or change their details. The emails in this section are usually noreply@mydomain.com.

transactional settings

Editing From email address for system messages
noreply@[DOMAIN]

save changes

noreply@gingerling.co.uk

Name for system messages
gingerling

Reply-to email address for system messages
noreply@gingerling.co.uk

Noreply is used because it is common for subscribers to reply to these emails, for example asking to be unsubscribed. Subscribers should be encouraged to use the automated processes provided by phpList, which can unsubscribe them without any additional work by the list manager (you!).

In addition to specifying the email addresses to be used for transactional messages, this section also deals with the content of these emails. These are ready-made for you, however, you may wish to customize them to reflect your circumstances or brand identity.

If you do this, make sure not to remove any of the important information included in the default messages, especially the placeholders in [square brackets].

Welcome to our Newsletter

 **Message subscribers receive after confirming their email address**

Welcome to our Newsletter

Please keep this message for later reference.

Your email address has been added to the following newsletter(s):

[LISTS]

To update your details and preferences please go to [PREFERENCESURL].

If you do not want to receive any more messages, please go to [UNSUBSCRIBEURL].

Thank you

 **Subject of the message subscribers receive when they have changed their details**

subscription-ui settings

This section deals with the design of subscribe pages. This section is dealt with in the chapters on subscribe pages.

Segmentation settings

This section allows you to edit your list category organization. This is dealt with in the chapter about categories.

Subscription settings

This section provides you with the links to various functional pages within your phpList install. Most of the time you should not edit these settings. They provide a useful reference.

Composition settings

This area changes depending on which plugins you are using, and has some useful tweaks for your WYSIWYG editor. For example you can specify the width of the editor. This might be useful if you plan to compose your campaigns on a tablet computer or smart phone.

You're done!

You should now see a green thumbs up next to your settings verification. Don't forget, you can come back to this page at any time to update your settings, and refer back to this guide for help.

The screenshot shows a 'CONFIGURATION' screen with a title bar and a main content area. The content area is titled 'configuration steps' and lists several items with 'Go there' links and thumbs-up icons. The 'Verify Settings' item is highlighted with a red rectangular box around its row.

configuration steps		
Initialise Database	Go there	👍
Change admin password	Go there	👍
Verify Settings	Go there	👍
Configure attributes	Go there	👎
Create public lists	Go there	👍
Create a subscribe page	Go there	👎
Add some subscribers	Go there	👎

If you wish carry on with the rest of your set up, see the chapters corresponding to each item in the list, for example attributes or adding subscribers.

Upgrading a manual installation

You should upgrade your phpList installation frequently. By keeping up-to-date you can take advantage of the latest features in phpList which will make your work easier and help you advance your work.

Often, a new version will include security updates which are important to protect your data, and the personal details of your subscribers.

Upgrading from phpList 2 (orange) to 3 (grey) works well - if you are still using phpList 2 please upgrade as soon as you can.

Overview

If you installed phpList manually, this is the correct installation method for you. The process consists of the following steps:

- Download the new version
- Unzip the files
- Back up your database
- Back up your config.php
- Replace old version on your server with new version
- Replace new config.php with your back up
- Upgrade database with automated updater

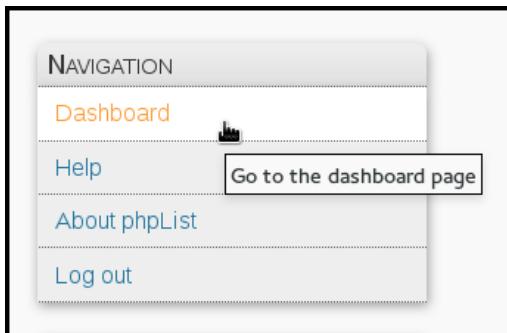

When to update

You can sign up for email notification about new versions of phpList by subscribing to our announcements list.

When normal configuration/settings have been maintained, phpList will check for updates every 7 days. You can adjust the frequency of checks on the **Config > Settings** page, accessed via the main menu.

When a new version had been released you will receive a notice on your dashboard.

You can navigate to your **Dashboard** from any page in phpList by clicking the link at the top of the **Navigation** sidebar.

If you see a notification saying "**A new version of phpList is available!**" then it's time to upgrade.

Downloading the new version

From your Dashboard notification, click **Download**.

A screenshot of the phpList dashboard. At the top, there are tabs for "Subscribers", "Campaigns", "Statistics", "System", and "C". Below the tabs, the word "DASHBOARD" is displayed. A yellow callout box contains the text: "A new version of phpList is available! The new version may have fixed security issues, so it is recommended to upgrade as soon as possible. Your version: 3.0.9. Latest version: 3.0.10. View what has changed" followed by a "Download" button with a download icon. At the bottom of the dashboard, there is a "Main" link.

This will take you to phpList.com/download, where you click **DOWNLOAD ZIP** or **DOWNLOAD TGZ**.

 **phpList.com**

Features Hosted **Download** Support

Download phpList

 [DOWNLOAD ZIP](#)

 [DOWNLOAD TGZ](#)

 [VIEW RELEASES](#)

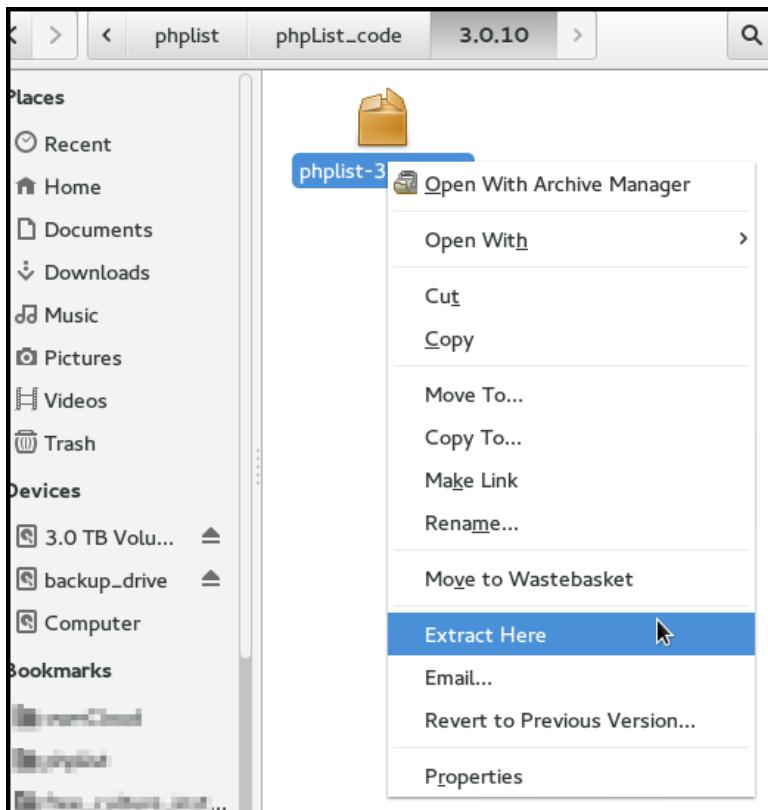

You will be redirected to SourceForge, where your download will start after a few seconds.

Choose a place on your computer to store the file and click **Save** (your own operating system/browser may work differently).

Unzipping phpList

Once you have downloaded phpList to your computer, unzip it. You can usually do this by right clicking and choosing **Extract Here** (Linux, as in screenshot), double clicking the folder (mac) or right click "extract all" (windows).

Next you must back up your installation, this is a vital step as it will keep your data safe if anything goes wrong with the upgrade process.

Back up your database

The method of doing this will depend on your hosting provider. In this example we use cpanel. Click on the **MySQL Databases** icon.

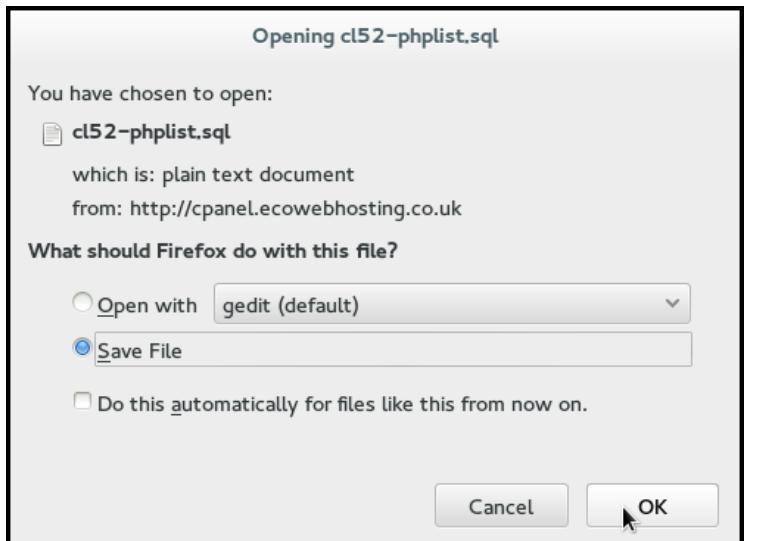

Locate your phpList database and click **Backup**.

Manage MySQL Databases

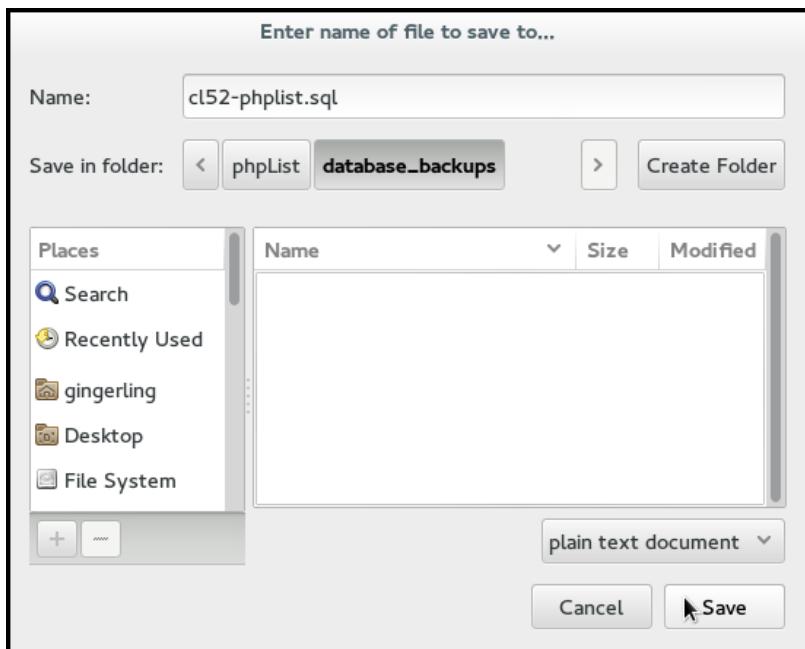

To restore a database which you've previously backed up, click **Restore Backup**.

Server	Username	Password	Utilities	Usage
192.168.1.100	wordpress	<input type="text" value="XXXXXXXXXX"/>	Manage Backup	2MB
192.168.1.100	phplist	<input type="text" value="XXXXXXXXXX"/>	Manage Backup	18MB

Choose to **Save File** and click **OK**.

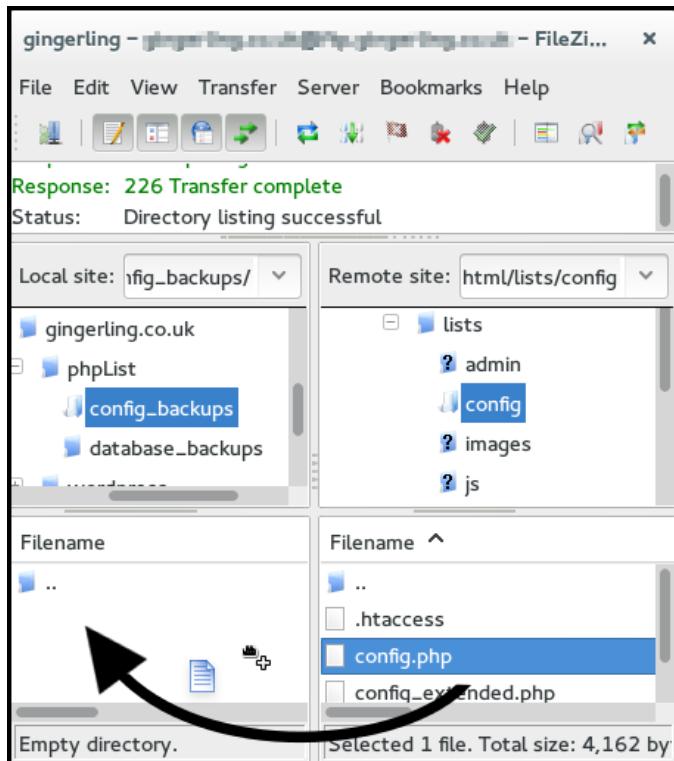

Choose a location on your computer to save your database too, and click **Save**.

Backing up your config.php

You also need to back up your config.php., which is usually located at **public_html/lists/config/config.php** on your server. You will need this file again later.

You can do this using an ftp client. In screenshot below we used filezilla and the config.php file was simply dragged and dropped onto into the backup folder.

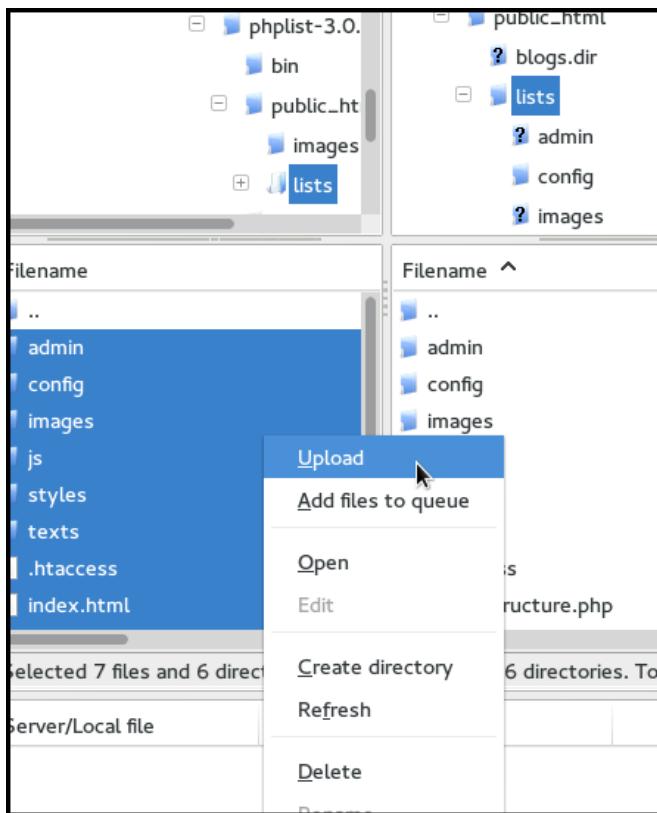

If you have customized/altered any other files for some non-standard scenario you should back them up too.

Upload the new version

Next you need to upload the new version files to replace the files from the previous version. You can do this using an ftp client. This is similar to installing for the first time. In the screenshots below we used filezilla.

First we selected all the files within the **public_html/lists** folder on our pc, then we uploaded them to the **public_html/lists** folder on our server.

You need chose to overwrite all files.

Action:

- Overwrite
- Overwrite if source newer
- Overwrite if different size
- Overwrite if different size or source ne
- Resume
- Rename
- Skip

Always use this action

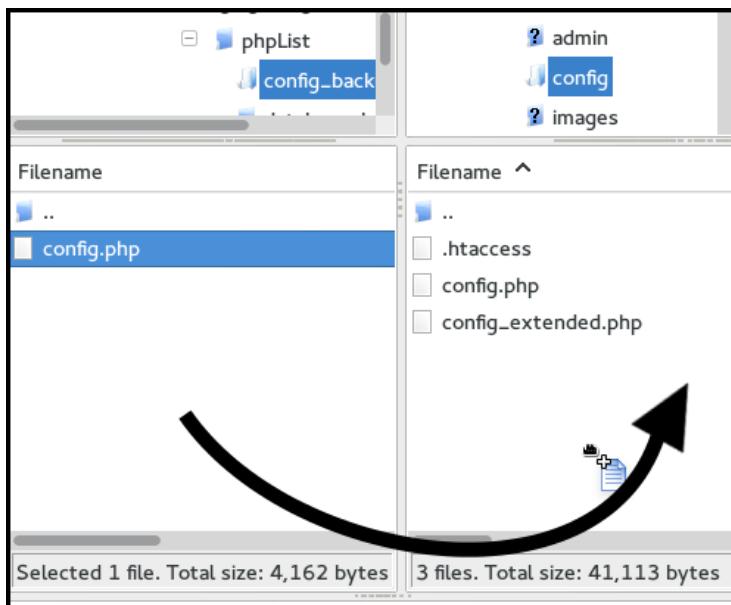

Apply to current queue only

Apply only to uploads

Replace new config.php with your own

Now you need to replace the new **config.php** file with the one you backed-up earlier, which has your system details already set up.

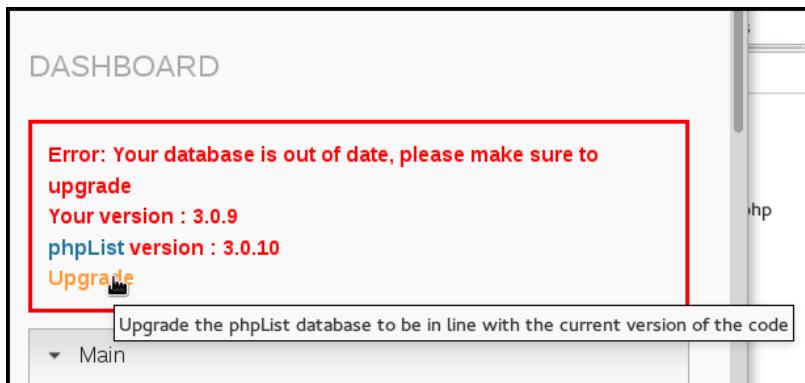

We did this using an ftp client.

Update your database

Finally, log in to your installation (<http://yourdomain.com/lists/admin>).

You will see a big red box at the top of the screen telling you to upgrade your database. Click **Upgrade**.

Read the text, and click **Upgrade**.

Your database version: 3.0.9

Your database requires upgrading, please make sure to create a backup of your database first.

If you have a large database, make sure you have sufficient disk space available for upgrade.

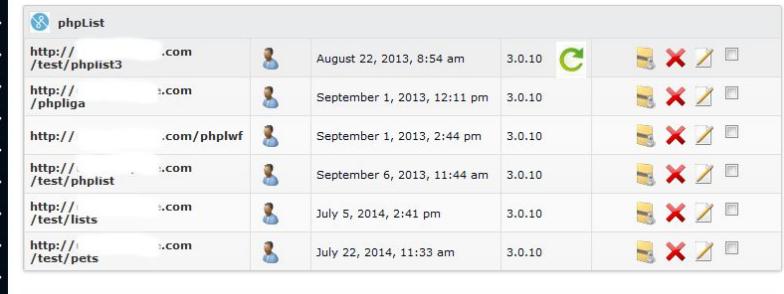

When you are ready click  Depending on the size of your database, this may take quite some time. Please make sure not to interrupt the process, once it started.

Success

Upgrading an auto-installed installation

Auto Installer Upgrade.

Providing you have used your web based auto installer (Softaculous/Fantastico) to initially install your phpList, you can simply update it by visiting the installers page and click on the upgrade link. NB: This will only appear when an update is available.

phpList						
>	http:// /test/phplist3	.com		August 22, 2013, 8:54 am	3.0.10	
>	http:// /phpliga	.com		September 1, 2013, 12:11 pm	3.0.10	
>	http:// .com/phplwf	.com		September 1, 2013, 2:44 pm	3.0.10	
>	http:// /test/phplist	.com		September 6, 2013, 11:44 am	3.0.10	
>	http:// /test/lists	.com		July 5, 2014, 2:41 pm	3.0.10	
>	http:// /test/pets	.com		July 22, 2014, 11:33 am	3.0.10	

Simply click the green upgrade icon and let the system upgrade your installation. Once completed, simply restore your customised files and the upgrade is complete.

Common Installation Errors

Possible Errors

Error 500.

The .htaccess file must be present in the lists/ directory and must contain the line "DirectoryIndex index.php" as this ensures phpList looks for index.php rather than the default index.htm(l).

Also because this file tries to be all things to all servers, if you get an Error 500 report when first running phpList the issue could be that there are lines that start "php_value" they have a better than 50:50 chance of crashing your installation with the dreaded Error 500. In this case, either remove the lines completely, or add a hash "#" to the start of any lines beginning with php_value (so it would look like this #php_value) and resave the .htaccess file.

mySQLi error:

If you receive an error referring to mySQL or mySQLi then you need to change this line "\$database_module = "mysql.inc";" to "\$database_module = "mysqli.inc";" the line in question is around 700-710 of the full config.php file

From version 5.5 of PHP, the mysql_ functions have been deprecated.

SENDING

Methods of Sending (Browser, Cron, Command-line)

Setting up phpList for sending is a complex topic, there are many (many) variables, most of which which are out of the control of phpList developers, such as your hosting provider and server configuration.

In our early chapters, we have assumed that you are sending from the browser, to a small list, and that your phpList has been configured already.

How sending works

Once your campaign is ready, you need to tell phpList to send the campaign. There are two steps to this:

1. Submit the message to the queue.

When creating the campaign, the last tab of the workflow is the 'SEND' tab. Pressing the 'start campaign' button submits the campaign to the sending queue.

2. Process the queue, either manually via the browser or command line, or automatically via a cron job or remote queue processing system.

Manual sending using the browser

This is the simplest way to send. You must:

- Leave the browser open while you process the queue
- Leave your computer active (not asleep) while you process the queue
- Be aware that your hosting provider may not allow emails to be sent this way by default, or may suspend your account if you send volumes which breach their terms and conditions.

This method of sending works essentially as described in the chapter on Sending your first campaign. Using the default configuration file settings, either click the **Process Queue** button which is presented as the final step of the campaign workflow, or use the **System > Process queue** option from the main menu.

Once you begin sending you must leave the browser open: if the browser is closed while the message is sending, the queue processing will stop. To continue sending where you dropped off, you will need to open the browser, log into phpList, and "System"/"Process queue" again, leaving the browser open.

The system will send the queue using the settings in your config file (config.php), which controls the send rate, the envelope header, and so forth. You should talk to your hosting provider about these settings, they may want you to send in small batches or have a cap on the number of mails you can send each hour.

phpList.com remote queue processing

One way to bypass the issue of leaving your browser open without creating a cron job is to use the phpList.com remote queue processing system.

This means that once you click to process the queue, phpList.com will keep your system sending after you close your browser: you are still sending from your server, and according to the settings in config.php - phplist.com just keeps your system "awake" for you.

You will be prompted to consider this process the first time you send. If you have previously sent messages then visit <http://yourdomain/lists/admin/?page=hostedprocessqueuesetup> to get started.

You should see the following page.

Click **Create Account**.

The screenshot shows a web browser window with the URL 'lists/admin/?page=hostedprocessqueuesetup'. The page title is 'phpList'. The navigation menu includes 'Subscribers', 'Campaigns', 'Statistics', 'System', 'Config', and 'Info'. The main content area has a heading 'SETUP PROCESSING USING THE HOSTED SERVICE' and a sub-section 'Process the queue using the service from phpList.com'. A note states: 'This is only possible if your phpList installation is not behind a firewall'. Below this, 'Step 1. Create an account on phpList.com' is described, with a note: 'For the purpose of remote processing go to [Create Account](#) and follow the steps.' Another note says: 'If you use the normal registration procedure it will create a phpList Hosted account for you, which is not what you need for remote processing.' A third note says: 'Once you are registered, go to your account page and request an API key'. 'Step 2. Enter the API key here' is the next section, with a text input field labeled 'API key from phpList.com' and a 'Continue setup' button.

SETUP PROCESSING USING THE HOSTED SERVICE

Process the queue using the service from phpList.com

This is only possible if your phpList installation is not behind a firewall

Step 1. Create an account on phpList.com

For the purpose of remote processing go to [Create Account](#) and follow the steps.

If you use the normal registration procedure it will create a phpList Hosted account for you, which is not what you need for remote processing.

Once you are registered, go to your account page and request an API key

Step 2. Enter the API key here

API key from phpList.com

Continue setup

This opens a window with a phpList.com page enabling you to create a special phpList.com account. Fill out your details and click **Create account**.

CREATE AN ACCOUNT

This registration page will give you an account on the phpList website for various purposes. It's a phpList installation for you. After registration you can get an API key for remote processing of your self-hosted phpList installation.

Fields marked * are required.

Create your account:

email

password

Minimum of 8 characters with at least one number is required.

confirm password

You then need to go to your email account and click the link in the confirmation email.

phpList Hosted: Request for confirmation

API Key

Generate new key

Thank you for using our new mail queue processing service. We are still working on the plans for this service, so in the meantime you can use this service for free. We will let you know when there is an update.

Please use the [Contact Us](#) link on the top right, if you encounter any issues with our service.

Thanks

If the status section shows the error "Request timed out", this means that our request to your installation has timed out. You can try to start it again by suspending a campaign and then requeueing it.

Copy the API key.

status Free trial

API key **1c3534c7fcdf8530**

Thank you for using our new mail queue pr
plans for this service, so in the meantime yo
you know when there is an update

And paste it into your phpList installation, into the **Enter the API key here** box on <http://yourdomain/lists/admin/?page=hostedprocessqueuesetup>

This is only possible if your phpList installation is not behind a firewall

Step 1. Create an account on phpList.com

For the purpose of remote processing go to [Create Account](#) and follow the steps.

If you use the normal registration procedure it will create a phpList Hosted account for you, which is not what you need for remote processing.

Once you are registered, go to your account page and request an API key

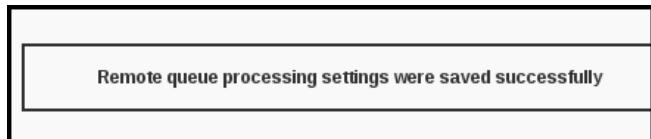

Step 2. Enter the API key here

API key from phpList.com

1c3534c7fcdf8530 |

Continue setup

Click **Continue setup**.

The process is now complete. When you add a message to the queue, it will be processed according to your settings.

If you wish to disable this functionality in the future, go back to ?
page=processqueue and click the **Reset Choice** button.

A screenshot of the phpList admin interface. The URL in the browser bar is "gingerling.co.uk/lists/admin/?page=processqueue". The page title is "phpList". The main navigation menu includes "Subscribers", "Campaigns", "Statistics", "System", "Config", and "Info". Below the menu, the heading "SEND THE QUEUE" is displayed. A text area says "To send your queue, you use the service from phpList". There are three buttons: "View progress", "Change settings", and "Reset choice". The "Reset choice" button is highlighted with a red rectangular border.

Queue processing from a remote computer using a secret (Config > Settings > Secret for remote processing)

This is essentially the same system as above, but you don't use the [phplist.com](#) service, you use another server of your choosing. Documentation for this is here.

Automatic queue processing using the command line and Cron jobs

Background

A more advanced phpList configuration is to configure automatic queue processing from the command line of the computer (shell terminal). These are the most powerful ways of sending and they have many advantages. However, setting them up can be complicated for a variety of reasons including:

- Restrictions of hosting companies, such as GoDaddy, Hostgator and others
- Features of your virtual machine (VM) hosting account
- (In)Ability to ssh into the server to test commands
- PHP settings configured by your hosting company
- Working through a web based interface such as cpanel, or plesk to test and setup the required exact commands needed
- Limited access and permissions due to account type and user limitations
- Every hosting company sets this up a little differently, so require a setup specific to your exact situation.

If you don't understand, or give up trying to understand all these details, look for qualified third party support to configure this and/or offer hosted solutions that include automatic queue processing.

The Command line

The core of setting up the automatic processing is the command line that will 'do the deed'.

For queue processing, the general format is:

```
/usr/bin/php /home/mydomain/lists/admin/index.php -pprocessqueue  
-c/home/mydomain/lists/config/config.php
```

Breaking this down:

/usr/bin/php This is the command that invokes php. Your path may vary, as well as the exact php command (php-cli or php-cgi). The exact path to the php command will need to be changed to match your system.

/home/mydomain/lists/admin/index.php This is the fully qualified path to the index.php file in the /lists/admin directory of your phpList installation, as seen by the php command (above). Getting this right usually requires some experimenting, and/or asking your hosting provider. The '/home/mydomain' part will need to be changed to match the layout of your system.

-pprocessqueue This specifies the action that you want to perform (processqueue)

-c/home/mydomain/lists/config/config.php This is the fully qualified path to the config file with your settings. The '/home/mydomain' part will need to be changed to match the layout of your system.

Once you determine the exact command line that will process the queue on your machine, then you need to run that command periodically via a cron job (also called a 'scheduled task' in the cpanel interface).

Setting up a cron job to periodically run the Command Line

See the chapter "Setting up your Cron."

Setting up your Cron

What is cron

Cron is a time based task scheduler on Unix-like operating systems. For more information check the Wikipedia page. This chapter will describe how to set this up on Linux. On other Unix systems the set up will be similar.

Why set up cron

When you set up the cron, two of the most time consuming parts of phpList will become automated. These are processing the queue and processing the bounces. Once you set up the cron, you will not have to do these in your browser, but they will happen automatically. Sending a campaign will become as easy as sending a normal email from your desktop.

Caveats

The method described in this chapter requires the CLI version of PHP. This may not be available on all systems. There are some "hacks" to make it work with other versions of PHP, but this is non-intentional functionality and therefore not described here.

Step 1: set up commandline

The easiest way to set up the cron is to set up a commandline script that will handle all phpList commands. There is an example in the "bin" directory in the phpList archive file.

Let's call the commandline script "phplist" and edit it with your favourite text editor:

```
$ vi phplist
```

and type (or copy-paste) the content

```
#!/bin/bash  
/usr/bin/php  
/home/website/public_html/lists/admin/index.php -c  
/home/website/public_html/lists/config/config.php $*
```

You will need to change the above content to fit your system:

#!/bin/bash -> the shell that you want to use

/usr/bin/php -> the path to the PHP-cli commandline interpreter, this can vary per system. Debian based systems (including Ubuntu) should install the "php-cli" package.

/home/website/public_html/lists/admin/index.php -> the path to your phpList installation, pointing to the index.php file in the admin directory of phpList

/home/website/public_html/lists/config/config.php -> the path to your config file

Once you have constructed your commandline file, place it somewhere in your path, e.g. in /usr/local/bin and make it executable.

```
chmod 755 /usr/local/bin/phplist
```

From then on, you can process phpList on commandline, for example with

```
phplist -pprocessqueue
```

Step 2: set up the crons

Once you have the commandline script, you can set up the crons with your favourite cron editor. On Linux, you type "crontab -e" in order to edit your cron entries.

```
0-59/5 * * * * phplist -pprocessqueue > /dev/null 2>&1
0 3 * * * phplist -pprocessbounces > /dev/null 2>&1
```

The above example will process the queue once every 5 minutes and process the bounces once a day. That will be sufficient for most systems.

The example also discards any output, which you will want to do. You can always check the output by running the above commands manually from the shell-prompt.

Step 3: tell phpList

Once you've set up the cron and it is working, you can tell phpList and some links will disappear. Put the following two lines in your config file:

```
define ("MANUALLY_PROCESS_BOUNCES",0);
define ("MANUALLY_PROCESS_QUEUE",0);
```

This will hide the links to process the queue and bounces from the phpList interface.

Notes

There's no danger in overloading your server. When a second queue processing command is activated when the previous one is still active, phpList will detect this and bail out. Therefore there will always be one active queue sending process at any time. This is also important to ensure that the sending limits, set with Batch processing, will be honoured.

Scheduling

In the campaign workflow you will find the scheduling tab.

If you want to send a campaign straight away, and there is no need to stop sending before a specific time, then you can leave these details unchanged and your campaign will simply send.

If your needs are more complex, read on.

Important information

Scheduling settings interact with your sending method. If you are only able to process your queue from within the browser because you have no cron or command-line access, then the embargo time feature will not work for you. To send a campaign from the browser you must *always* open your browser to process the queue and keep it open until you have finished, even if you have used an embargo time.

Scheduling tab

Below is an image of the scheduling tab. We we will work though it from top to bottom:

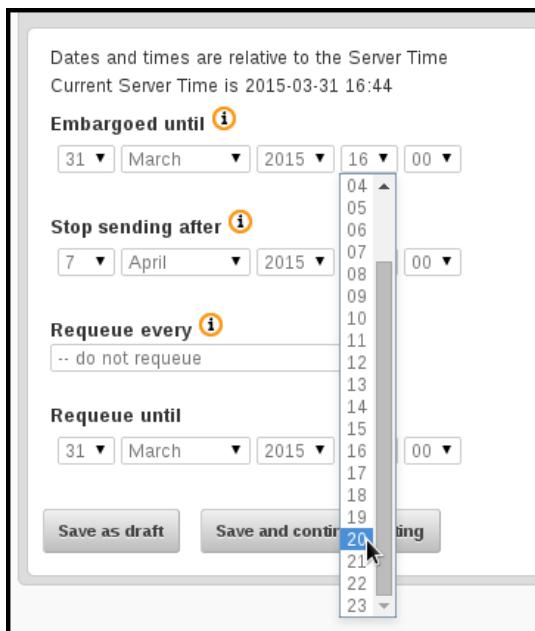

□ Current time

The server time may not be the same as your local time. All of the times in the scheduling page are relative to server time. Changing this time is an advanced feature.

Embargoed until

The campaign will not be sent until this time has passed. If you have a campaign which you wish to send at a later date, perhaps when you out of the office or away from your desk, then this is the feature you should use.

Embargo time is initially set to the nearest hour *before* you started your new campaign: this effectively switches off the embargo feature by default. To use the feature you must set the time in the future. Simply set the date and time to the time you want to send, relative to your server time which is stated above. Then place the campaign in the queue as normal. If you are using a cron job then the campaign will automatically start sending at the desired time.

Stop Sending After

This feature is used when the topic of a campaign is time sensitive, for example, a special offer with an expiration date or an event with a specific time. If the campaign would become irrelevant to anyone who received it after a particular time, then this is the feature you should use.

The primary use of this feature is when your list size exceeds your sending capacity within the timeframe you need to send your campaign in. For example, if you have a list of 10,000 subscribers and can send 1000 emails in an hour but the campaign becomes irrelevant in 8 hours time, you need to stop sending before everyone on your list has received a copy of the mail.

Re-Queue

The re-queue setting is used to send a campaign to subscribers who join a list *after* the campaign is sent. Remember, a campaign will never be sent to the same subscriber twice.

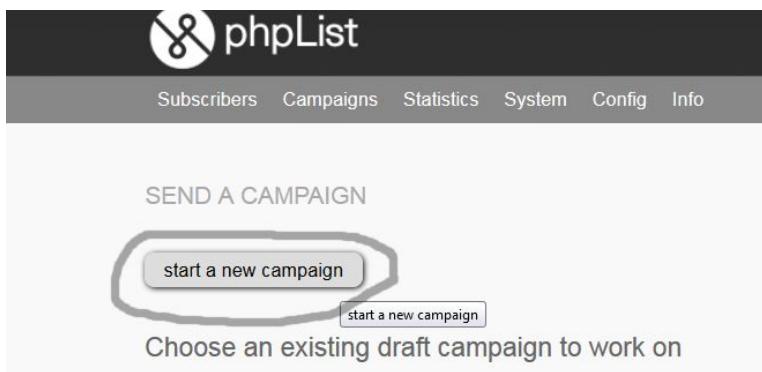

□

As an example, you create a monthly newsletter on the first of January, and send it to a list. Over the month you expect another 50 people to sign up, or be added to your list manually, and you would also like them to automatically receive a copy of the campaign. You would set up your campaign to **re-queue every** day and to **re-queue until** 31st of January.

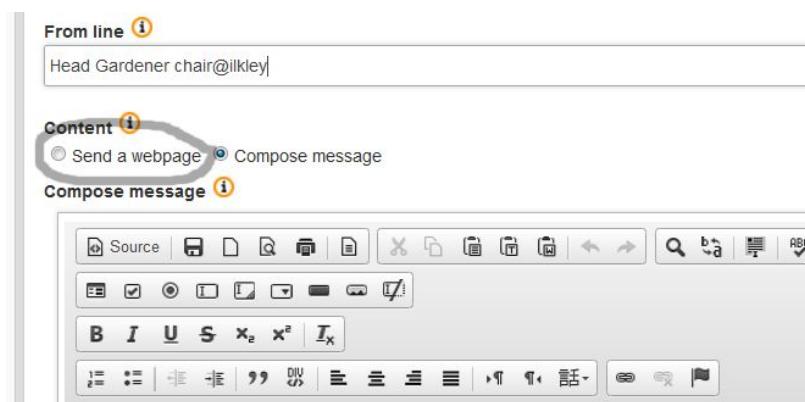

Sending a web-page

To send a web page rather than a message to your subscribers, log in to your phpList admin pages, then choose to Send a Campaign Admin>Campaigns>Send a Campaign

From this page, click on Send a New Campaign (or edit an existing Campaign). In this example, I'll use Send a New Campaign.

This results in:

Choose Send a Webpage rather than Compose message and you should see this:

From line

Head Gardener chair@ilkley

Content

- Send a webpage Compose message

Send a webpage - URL

http://dragonrider.co.uk

URL is valid

Footer

```
<div class="footer" style="text-align:left; font-size: 75%;>
```

In the send a web page - URL box, enter the path of the webpage you wish to send. Click outside the box and the URL is validated.

If you get this message, then check and double check that the page you have entered actually exists. The URL does look correct, but the page does not in fact exist.

Head Gardener chair@ilkleygardeners.org.uk

Content

- Send a webpage Compose message

Send a webpage - URL

http://www.h.../ista.org/dem2.htm

Error fetching URL. Please verify that the URL entered is correct.

Footer

```
<div class="footer" style="text-align:left; font-size: 75%;>
<p>This message was sent to [EMAIL] by [FROMEMAIL]</p>
<p>To forward this message, please do not use the forward button of your email application,</p>
```

Once the page to be sent has been validated, simply select the template for your message (optional), the list to which you wish to send to (required), check that the embargo time is correct and send the campaign out.

Display Issues

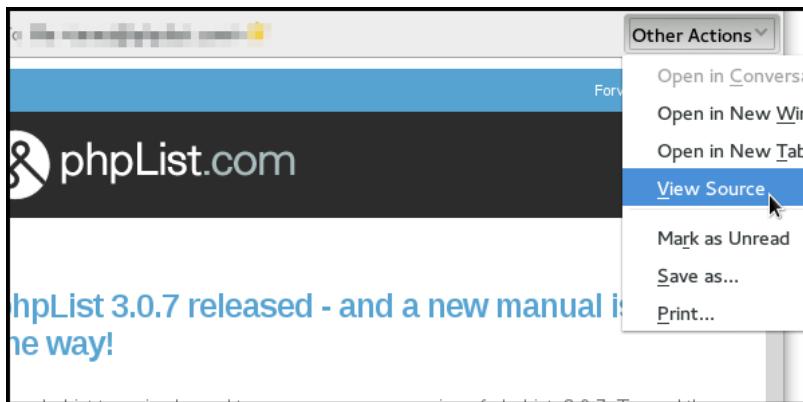

Be aware that most email readers, especially those web-based ones (Hotmail/Outlook, Gmail etc) will not show images by default, it will be up to your subscribers to decide if they wish to receive images in emails by (usually) clicking on a link in the email reader. Don't assume that your images will automatically appear, so make sure your webpage includes ALT Text for each image in your page when designed.

Sending plain text

phpList always generates a plain text version of your campaign, which is then included in the html campaigns as a matter of course. This is part of the normal working of email functionality. phpList also gives you two additional features:

- Your subscribers can choose to receive plain text emails only
- You can edit the plain text version to improve it.

You can see the plain text version embedded in the source of your email by clicking **View Source** in your email client (exact instructions vary wildly)

As you can see there is a plain text version in and amongst the html and other code.

first and you will find the link to edit it at the top of the

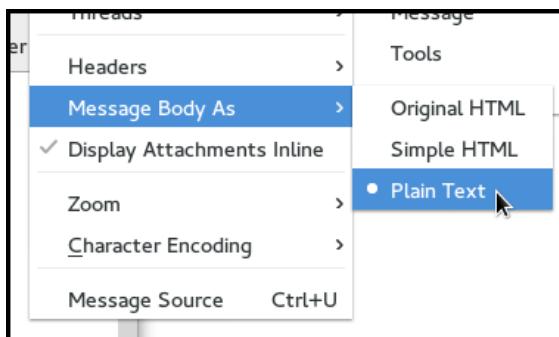

```

Why edit the plain text version?

The automatically generated plain text version may not be very attractive. It is good practice to provide a quality plain text version because it:

- displays better in some email software
- makes your emails more accessible for people with visual impairments.

To assess the state of your default plain text version, you can click to view your emails only in plain text. In a desktop email client this is usually **View > Message Body As > Plain text**.

You can then see your email as it would be displayed to someone who is only able to receive plain text messages.

<http://community.phplist.com/wp-content/u>

Send a web-page functionality update

Enabling plain text editing

Some installations do not show the **Text** tab, which is used to manually configure your text-only email content. If your tabs look like this, you'll need to change the configuration:

To activate the **Text** tab in your installation, add the following lines to your config.php file:

```
# Manual text part, will give you an input box for the text version of the message  
# instead of trying to create it by parsing the HTML version into plain text  
define('USE_MANUAL_TEXT_PART',1);
```

```
# Manual text part, will give you an input box for the text version of the message  
# instead of trying to create it by parsing the HTML version into plain text  
define('USE_MANUAL_TEXT_PART',1);
```

An extra tab will now display in your campaign workflow.

Create your plain text version

Once you've created your HTML version in the **Content** tab (tab 1) click the **Next** button.

phpList click next

You should now be in the second tab, **Text**.

You can manually compose the plain text version, or you can generate it automatically by using the **generate from HTML** button. *Some special characters in your html email may cause this automatic generation to fail. You can paste your text into this tab if you need to.*

The empty **Plain text version of message** box will now contain a text only version of your html message.

The content should be the same as the html version. However images in the html version will automatically be removed and replaced by text descriptions and urls are replaced by links. You can edit the message further if required, to make it as attractive and legible as possible.

Once you are happy with your plain text version, click **Save and continue editing** button, at the bottom of the text editing box, and carry on with testing and sending your campaign.

When you send tests, you will receive two emails, one text and one html.

Plain Text

From: Me <info@ethical-pets.co.uk>

Subject: Puurfect! 50% off Organic Cat Food (BB: 20/8/14)

To: Me <info@ethical-pets.co.uk>

Other Actions

Dear Cats (and your associated human servants):

Good news!

Some silly human types at Ethical Pets have accidentally over-stocked Yarrah Organic and MSC certified dry cat food (the one with 'fish in it').

They have lots of 3kg bags of this delicacy that are currently near their "best before"

So dear felines, Ethical Pets are hoping some of your humans would like us to bring some of these items for you.

HTML

Bounce Management

Introduction to bounce management

Whenever an email is sent via the internet, regardless of the email software used, the email is transmitted by an MTA (Mail Transport Agent). In most cases the MTA is the internet provider's SMTP mail server, sending to the MTA of the email's recipient, through intermediary MTAs.

If the email cannot be delivered to its recipient, the last MTA that tried to transmit the email generates an error email, called a bounce message, which is sent back to the sender's email.

Usually, this bounce message contains a specific error code that explains why your email could not be delivered to its recipient.

phpList implements bounce management which handles these bounce messages, and provides automatic actions depending on the error code, like removing an incorrect email address.

Setting up basic bounce management

Basic bounce management counts bounces and unconfirms a user after a given number of consecutive bounces.

Setting your bounce address

In order to use bounce management, you need to provide an email address where the bounce messages are sent to (e.g.: `bounce@example.com`). This email address is usually called the Return Path. Note that this email address will only be added to the email headers, and will not be shown to your users.

Once you have set up your return path email address, you may edit the config.php by adding the following:

`$message_envelope = 'bounce@example.com';`

By default this setting is commented out (it has a # in front so will not be actioned).

□

You will need to uncomment it (remove the hash) and change the email to reflect your new bounce email.

```
# root should make this an address that no PERSON reads
# but a mailbox that phpList can empty every so often, to

$message_envelope = 'bounces@mydomain.com';

# Handling bounces. Check README.bounces for more info
# This can be 'pop' or 'mbox'
$bounce_protocol = 'pop';
```

pop or mbox

phpList can fetch emails from the bounce mailbox via two protocols, mbox protocol where mails are accessed directly within a folder on the server, and pop3 protocol where mails are downloaded just like a mail client program would do it. The latter one is usually the simplest option, especially if you don't host your phpList setup yourself.

You can specify which protocol to use in config.php with the following:

```
# This can be 'pop' or 'mbox'

$bounce_protocol = 'pop';
```

When accessing the bounce mailbox via mbox protocol, we need to tell phpList where the mbox files are. Edit config.php and add the following:

```
# when the protocol is mbox specify this one

# it needs to be a local file in mbox format, accessible to
your webserver user

$bounce_mailbox = '/var/spool/mail/listbounces';
```

When accessing the bounce mailbox via pop3 protocol, we need to tell phpList which server provides the emails, and the username and password for the mailbox in config.php like this:

```
# when the protocol is pop, specify these three

$bounce_mailbox_host = 'pop.example.com';

$bounce_mailbox_user = 'popuser';

$bounce_mailbox_password = 'password';
```

Additionally, you might want to set the default pop3 port and encryption with the following line (standard config):

```
$bounce_mailbox_port = "110/pop3/notls";
```

Or enabling ssl on port 995 without verifying certificate common name of the certificate:

```
$bounce_mailbox_port = "995/pop3/novalidate-cert"
```

Setting up mailbox purge

Unless you're doing some tests, you would want to delete bounce messages once they are fetched, so they won't be counted twice:

```
$bounce_mailbox_purge = 1;
```

You may also want to delete messages from the mailbox that could not be processed because they do not match a user in the system. Messages are still downloaded into phpList, so it's safe to delete them from the mailbox.

```
$bounce_mailbox_purge_unprocessed = 1;
```

You can define how many bounces in a row it needs for a user to be marked unconfirmed.

Be aware that deleting processed bounce messages from phpList with advanced bounce rules will disable this functionality.

```
$bounce_unsubscribe_threshold = 5
```

Downloading and processing bounces

Downloading and processing bounces can be handled in the user interface under **System > Process Bounces**.

You may also setup a cron task to download and process bounces on a regular basis, see the chapter about cron tasks.

In that case, you might want to disable the Process Bounces menu entry by adding the following:

```
define ("MANUALLY_PROCESS_BOUNCES",0);
define('BLACKLIST_EMAIL_ON_BOUNCE', 1);
```

Advanced bounce management

Advanced bounce management enables the automatic performance of various actions depending on the kind of bounce error code that is returned by the MTA.

To enable it just add the following in config.php

```
define('USE_ADVANCED_BOUNCEHANDLING',1);
```

Once this is set up, you may proceed in the phpList interface to **System > Manage Bounces > List Bounces Rules**

MANAGE BOUNCES

List Bounce Rules
View Bounces
View Bounces per list
Check Current Bounce Rules
Process Bounces

You have already defined bounce rules in your system. Be careful with generating new ones, because these may interfere with the ones that exist.

Generate Bounce Rules

From there you may create new bounce rules, based on regular expressions that will trigger phpList actions.

Regular expressions are sequences of characters that match a search pattern. While this manual won't explain the use of regular expressions, we will analyse the examples given here.

Bounce emails generally contain a header and a mail body that may, depending on the MTA that sent the email, give a reason why the initial email could not reach its recipient.

An example bounce email could look like the following:

Final-Recipient: rfc822; someuser@example.com

Original-Recipient: rfc822;someuser@example.com

Action: failed

Status: 5.2.1

Remote-MTA: dns; mx1.example.com

Diagnostic-Code: smtp; 550 5.2.1 This mailbox has been blocked due to

inactivity (UserSearch)

What we see here is the recipient's MTA telling us that the user's mailbox is blocked, probably because it's not been used for a long while. There are some excellent articles about MTA responses on the internet. Every MTA programme has its own return messages. Also, you may have noticed that the return messages usually come with a 3 digit code, 5.2.2 in this example.

This code is the error code corresponding to the return message, but some MTAs just give bogus codes, especially when they think your email is spam.

Now let's create our first bounce rule:

BOUNCE RULES

Number of candidate rules: 18

ACTIVE ▾

No Rules found

add a new rule

Regular Expression

action ▾

Memo for this rule
Mailbox not in use anymore

Add new Rule

The regular expression could be the exact sentence the MTA return message contained, in brackets.

Now phpList provides multiple actions that can be triggered if a bounce email matches our regular expression:

- Delete subscriber
- Unconfirm subscriber
- Blacklist subscriber
- Blacklist email address
- Delete subscriber and bounce
- Unconfirm subscriber and delete bounce
- Add subscriber to the do-not-send list and delete bounce
- Add email address to the do-not-send list and delete bounce
- Delete bounce.

In our case, we can assume that our subscriber's email address haven't been used for a long while, and that it's safe to unconfirm the subscriber.

Now we have a choice between "unconfirm subscriber" and "unconfirm subscriber and delete bounce". The only real difference between both options is that deleting the bounce message will also remove it from bounce statistics (using the `BounceStatisticsPlugin`).

Once we finished our rule, we may add it and try it against our bounces.

Back in phpList, we can check if our rule matches any of our actual bounces, by going to **System > Manage Bounces > Check Current Bounce Rules**.

The system will then tell us how many bounces are caught by our rules.

Now you may have a big list of bounces that aren't caught by the rule, and some of them are pretty similar to the rule.

We may have multiple bounce messages that could say "account is disabled" or "This account has been disabled" which basically means the same as "mailbox has been blocked due to inactivity" of our first rule.

Way may create two other rules to deal with these bounces, or improve our regular expression to match all these messages with the same rule.

Regular expressions use the pipe symbol "|" as OR statement, meaning the following regular expression:

(black|white) would match any text that has the words black or white in it.

Now let's improve our first rule by adding all our MTA return messages that basically mean the same thing:

□

The actual regular expression I used here is:

(account is disabled|This mailbox has been blocked due to inactivity|This account has been disabled|The email account that you tried to reach does not exist|This is a permanent error * local delivery failed)

Note that the * is a wildcard token that means there can be up to zero characters between "This is a permanent error " and " local delivery failed".

This rule can now deal with any of these 5 return messages.

Good starter rule set:

Bounce Regular Expressions						
BOUNCE REGULAR EXPRESSIONS	EXPRESSION	ACTION	#BNCS	TAG	ORDER	DEL
rule 33	(User unknown Unknown user Unknown address No such recipient No such user The email account that you tried to reach is disabled Recipient not found Recipient unknown Invalid recipient Address unknown Recipient address rejected)	delete subscriber and bounce	3320	<input type="checkbox"/>	1	Del
rule 21	(sorry, no mailbox here by that name Mailbox disabled address not found in table User mailbox is not local mailbox not allowed Mailbox syntax incorrect RESOLVER\,ADR\,RecipNotFound)	delete subscriber and bounce	667	<input type="checkbox"/>	2	Del
rule 6	(delivery error: dd This user doesn't have a yahoo.fr account This user doesn't have a yahoo.fr account)	delete subscriber	384	<input type="checkbox"/>	3	Del
rule 32	(account is disabled This mailbox has been blocked due to inactivity This account has been disabled The email account that you tried to reach does not exist This is a permanent error * local delivery failed)	delete subscriber and bounce	204	<input type="checkbox"/>	4	Del
rule 43	(Archived recipient.)	delete subscriber	91	<input type="checkbox"/>	5	Del
rule 48	(type=MX: Host not found)	delete subscriber	6	<input type="checkbox"/>	6	Del

Rules to copy

(Archived recipient.) Delete subscriber

(delivery error: dd This user doesn't have a yahoo.fr account|This user doesn't have a yahoo.fr account) Delete subscriber

(type=MX: Host not found) Delete subscriber. No mail records for the domain.

(sorry, no mailbox here by that name|Mailbox disabled|address not found in table|User mailbox is not local|mailbox not allowed|Mailbox syntax incorrect|RESOLVER\.\ADR\.\RecipNotFound) Delete subscriber and bounce. No ambiguity here, we can also delete the bounce message.

(account is disabled|This mailbox has been blocked due to inactivity|This account has been disabled|The email account that you tried to reach does not exist|This is a permanent error * local delivery failed) Delete subscriber and bounce.

Same as above

(User unknown|Unknown user|Unknown address|No such recipient|No such user|The email account that you tried to reach is disabled|Recipient not found|Recipient unknown|Invalid recipient|Address unknown|Recipient address rejected) Delete subscriber and bounce. Same as above

PLUGINS

phpList Plugins

Your phpList can be extended, adapted and customized by the use of plugins.

You can:

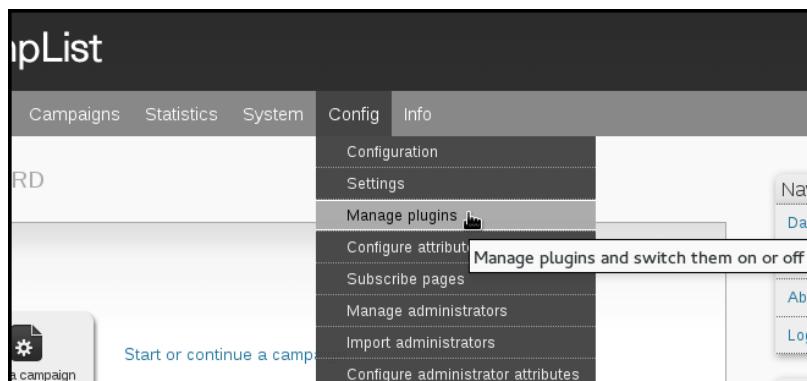

- Use plugins from the phpList plugin library, which are developed by the phpList community
- Develop your own plugin, or pay a developer to build it for you
- Contribute your plugin back into the plugin library.

This chapter will show you how to install, enable/disable and delete a plugin.

In the example used, we will change the choice of editor used in our install by installing the CKEditorPlugin and disabling the fckphplist plugin.

The plugins page

To get to the plugins page from the main menu, click **Config > Manage plugins.**

You will see a list of the plugins you currently have installed. To find new plugin click the **Find plugins** link.

The screenshot shows a web-based application interface for managing plugins. At the top, there is a navigation bar with links: Subscribers, Campaigns, Statistics, System, Config, and Info. Below the navigation bar, the main content area has a title "MANAGE PLUGINS".

The first section, titled "Install a new plugin", contains a search bar with the placeholder "Find plugins" and a button labeled "Install plugin".

The second section, titled "Installed plugins", displays a table with one row. The table has two columns: "INSTALLED PLUGINS" and "ENABLED". The row shows a plugin named "fckphplist" which is "ENABLED".

INSTALLED PLUGINS	ENABLED
fckphplist	

Details for the "fckphplist" plugin:

- Details**:
 - Name**: FCKeditor plugin for phpList
 - version**: 0.1
 - Description**: The original WYSIWYG editor for phpList

the plugin library will then open in a new page.

Getting the plugin URL from the plugin library

Once you have clicked the **Find plugins** link, you will see the plugin library. Scroll down or search to find the desired plugin.

In this example we are installing the CKEditorPlugin.

Right click on the **Download** link and choose the option to copy the url. The wording of this option will depend on your browser: in this case it reads **Copy Link Location**.

Provides: Tags: Duncan
Manage Campaigns plugin
Provides extra commands to manage campaigns. For phplist 3.x

Provides: Tags: campaigns Duncan
CAPTCHA plugin
This plugin provides a CAPTCHA field on subscription forms.

Provides: Tags: spam Duncan
CKEditor plugin
This plugin provides CKEditor, an HTML text editor, for editing messages and templates. phplist 3.x.

Provides: Tags: editor Duncan Cameron
TableList plugin

Save Link As...
Copy Link Location
Search Google for "Download CKEditor Plus: Block image..."
Inspect Element (Q)
Save images
Inspect Element with Firebug
Find in Elog.io
Download 2013-04-12

Installing the plugin

Return to your phpList (it should be in the browser tab to the left of the plugin library). Paste the url into the box labelled **Plugin package URL** and click the **Install plugin** below.

MANAGE PLUGINS

Install a new plugin

Find plugins

Plugin package URL

https://github.com/bramley/phplist-plugin-ckeditor/archive/master.zip

Install plugin

Installed plugins

INSTALLED PLUGINS	ENABLED
fckphplist	

You will see the plugin install. Click **Continue**.

Manage plugins and switch them on or off

Turning plugins on and off

Once you are on the plugins page, either from **Config > Manage plugins** on the main menu, or after installing a plugin and clicking **Continue**, you can turn plugins on or off.

A green thumbs up icon indicates that the plugin is enabled (on) and a red thumbs down icon indicates that the plugin is disabled (off).

To disable (turn off) a plugin click on the green thumbs up.

Installed plugins		
INSTALLED PLUGINS	ENABLED	DELETE
CKEditorPlugin		
Details		Name CKEditor plugin version 2014-12-21 Description Provides the CKEditor for editing mes installed 2015-03-11 installation Url https://github.com/bramley/phplist Developer bramley
fckphplist		
Details		Name FCKEditor plugin for phpList <input checked="" type="checkbox"/> Yes version 0.1 Description The original WYSIWYG editor for phpl

This will now turn red: the plugin is now disabled.

Installed plugins		
INSTALLED PLUGINS	ENABLED	DELETE
CKEditorPlugin		
Details		Name CKEditor plugin version 2014-12-21 Description Provides the CKEditor for editing mess installed 2015-03-11 installation Url https://github.com/bramley/phpList-plugin-ckeditor Developer bramley
fckphpplist		
Details		Name FCKeditor plugin for phpList version 0.1 Description The original WYSIWYG editor for phpList

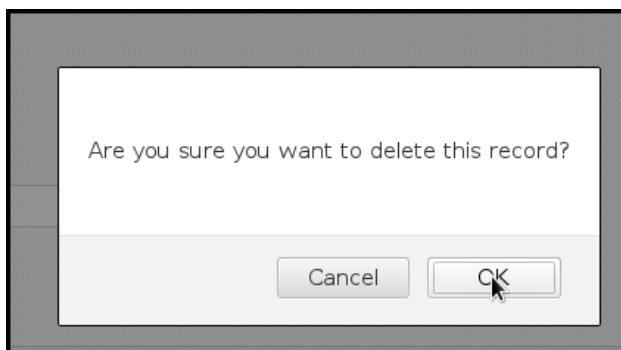

Deleting plugins

If you delete a plugin, you will lose any settings or data related to that plugin. If you are not sure, it is better to disable rather than delete.

If you are sure you want to delete a plugin, click the delete icon on the plugins page.

Installed plugins		
INSTALLED PLUGINS	ENABLED	DELETE
CKEditorPlugin		 delete this plugin

fckphplist		

Then click **OK** to confirm.

TRANSLATIONS

Setting up phpList in your own language

There are two "faces" of a phpList install, which can be set up in different languages:

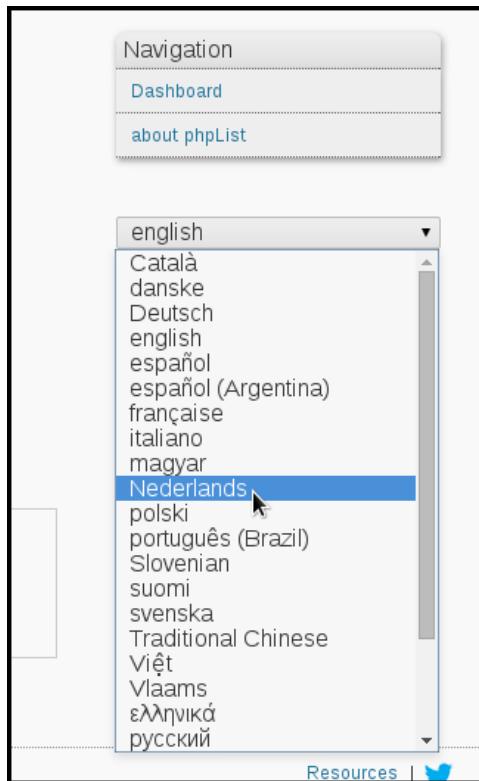

- What the administrators see, when sending campaigns for example.
- What subscribers, or potential subscribers, see, for example subscribe pages.

Changing language in the administrator interface

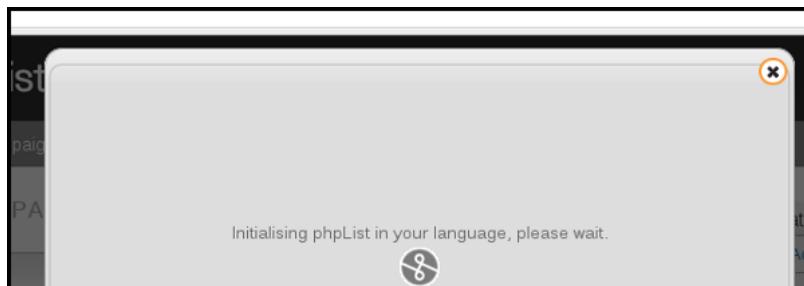

At all times, including before login, there is a language selector on the right hand side of your phpList. This sets the language of the administrator interface and is set to English by default.

To change this simply select your preferred language from the drop down.

If this is the first time you have used the language this will take a little time:

The phpList interface will then be displayed in your language to the fullest extent possible: if there are some words missing or incorrectly translated, you can improve the translation.

Public/Subscriber facing language

You can set a default language for all subscriber facing pages, and/or set the language of each subscribe page on a case by case basis.

If all of your subscribers are likely to speak the same language, for example, German, then you can set German to be the default language for subscribe pages. Then each new page you create will be in German by default.

Default Subscriber facing language

To change the default language for all subscribe pages, change english.inc to your language file. This file is found in lists/texts/.

The change is made in lists/config/config.php, right at the beginning of the file.

```
# select the language module to use  
# Look for <country>.inc files in the texts directory  
# to find your language  
# this is the language for the frontend pages  
$language_module = "english.inc";
```

Subscribe pages

If you send campaigns in more than one language then you can set a different subscribe page for each language manually.

When you create a new Subscribe Page you can choose the display language from the dropdown menu.

EDIT A SUBSCRIBE PAGE

▼ General Information

Title

Subscribe to our newsletter

Language file to use

- default
- default
- afrikaans
- arabic
- belgianflemish
- bulgarian
- catalan
- croatian
- czech
- danish**
- dutch
- english
- english-gaelic
- english-usa
- estonian
- finnish
- french
- german
- greek
- hebrew
- hungarian

```
</h3>
width=device-width, initial-scale=1, m
./images/phplist-touch-icon.png" />
<link rel="apple-touch-icon-precomposed" href=" ./images/phplist-touch
<link rel="stylesheet" href="styles/subscribe.css" type="text/css" />
<link rel="stylesheet" href="styles/color.css" type="text/css" />
</head>
```

We suggest you name your list and the subscribe page, for example, "Newsletter - in Danish" to help keep your pages and lists organised.

TROUBLESHOOTING

Troubleshooting Techniques

This chapter gives you some hints on how to troubleshoot a problem in phpList.

Where to go first

The first place to go for help is phpList.org, especially phpList.org/users - this page has the most up-to-date list of support resources and will guide you through the process of getting help step by step.

Describing your problem

One of the biggest barriers to problem solving is being able to describe the problem clearly and in enough detail. There is a useful article here to help you with that - it's especially worth a read if you are "not very technical".

If you have an error message

If you have an error message, try pasting it into a search engine. All our forums and documentation are fully indexed by search engines, and your solution is likely to pop up in the results.

Don't give up!

If you have a problem that is hard to solve, it could be a "bug." In this case, take a look at the bug reporting process described on the community site - our developer team may be able to fix your problem in the next version.
